

# Package ‘RCircos’

October 29, 2013

**Type** Package

**Title** Circos 2D Track Plot

**Version** 1.1.2

**Date** 2013-10-28

**Author** Hongen Zhang

**Maintainer** Hongen Zhang <hzhang@mail.nih.gov>

**Description** RCircos package provides a simple and flexible way to generate Circos 2D track plot images for genomic data visualization. The types of plots include: heatmap, histogram, lines, scatterplot, tiles and plot items for further decorations include connector, link (lines and ribbons), and text (gene) label. All functions require only R graphics package that comes with R base installation.

**License** GPL (>=2)

**Depends** R (>= 2.10)

 RCircos-package      *Circos-like Plot of Genomic Data*

---

**Description**

This is the R implement of basic Circos plots of genimic data.

**Details**

Package: RCircos  
 Type: Package  
 Version: 1.1.2  
 Date: 2013-10-22  
 License: GPL (>=2)

RCircos package provides a simple and flexible way to make Circos 2D track plots with R and could be easily integrated into other R data processing and graphic manipulation pipelines for presenting large-scale multi-sample genomic research data. It can also serve as a base tool to generate complex Circos images. Currently, RCircos supports genomic data plot for three species: human, mouse, and rat. Data plots include chromosome ideogram with cytoband, heatmap, histogram, lines, scatterplot, and tiles. Plot items for further decorations have connectors, links (lines and ribbons), and text (gene) labels. Each plot is implemented with a specific function and input data for all functions are data frames which can be objects read from text files or generated with other R pipelines.

*Draw Chromosome Ideogram*

### **Description**

Draw a circular chromosome ideogram with all or subset of chromosomes, chromosome names, and chromosome highlights. RCircos core components and graphic device must be initialized before drawing.

### **Usage**

```
RCircos.Chromosome.Ideogram.Plot()
```

### **Author(s)**

## Not run: RCircos.Set.Plot.Area();
## Not run: RCircos.Chromosome.Ideogram.Plot();

```

## RCircos.Clear.Track

### *Erase One or More Data Tracks*

## Description

Erase one data track or all tracks from current track to the center of plot area.

## Usage

```
RCircos.Clear.Track(track.num, side, to.center = FALSE)
```

## Arguments

- |           |  |
|-----------|--|
| track.num | Integer, representing the ordinal number of the plot track to be erased.   |
| side      | Character vector, either "in" or "out", representing the position related to chromosome ideogram.                          |
| to.center | Logic, FALSE for erasing current track only and TRUE for erasing all tracks from current track to the center of plot area. |

## Description

Calculate the index of Circos plot positions (a set of x- and y-coordinates for a circular line) for a genomic position (chromosome name and start position). This function is for internal use only.

## Usage

```
RCircos.Data.Point(chromosome, start)
```

## Arguments

chromosome	Character vector, a chromosome name with prefix of "chr", e.g., "chr1".
start	Integer, start position of a genomic interval (e.g, a gene or a band) on the chromosome.

## Value

An integer representing the index of RCircos plot positions.

## Author(s)

Hongen Zhang

RCircos.Env

*RCircos Environment*

## Description

RCircos.Env is the user environment to hold RCircos core components and each component in the environment can be viewed with get mothod.

## Format

The format is: <environment: 0x14f6c10>

RCircos.Gene.Connector.Plot

*Draw Connectors between Chromosome Ideogram and Gene Names*

## Description

Draw a set of connectors (three lines for each connector) between chromosome ideogram or a data track and gene names. RCircos core components and graphics device must be initialized before drawing.

## Usage

```
RCircos.Gene.Connector.Plot(genomic.data, track.num, side)
```

## Arguments

genomic.data	A data frame with the first four columns for chromosome names, start positions, end positions, and gene names.
track.num	Integer, representing the ordinal number of the plot track where the connectors are plotted.
side	Character vector, either "in" or "out" representing the position related to chromosome ideogram.

RCircos.Gene.Label.Data  
*Sample Data for Gene Labels*

---

## Description

RCircos.Gene.Label.Data contains genomic position information for 192 genes. Each row of the data contains genomic position and gene name for one gene in the order of chromosome name, start position, end position, and gene name.

## Usage

```
data(RCircos.Gene.Label.Data)
```

## Format

A data frame with 192 observations on the following 4 variables.

Chromosome	a factor with levels chr1 chr10 chr11 chr12 chr13 chr14 chr15 chr16 chr17 chr18 chr19 chr2 chr20 chr21 chr22 chr3 chr4 chr5 chr6 chr7 chr8 chr9 chrX

RCircos.Gene.Name.Plot  
*Draw Gene Names on a Data Track*

---

**Description**

Label gene names along chromosome ideogram or a data track. RCircos core components and graphic device must be initialized before drawing.

**Usage**

```
RCircos.Gene.Name.Plot(gene.data, name.col, track.num, side)
```

**Arguments**

gene.data	A data frame. The first three columns should be chromosome name, start position, end position.
name.col	Integer, representing the ordinal number of the column in input data that contains gene names.
track.num	Integer, representing the ordinal number of the plot track where the gene names are plotted.
side	Character vector, either "in" or "out", representing the position related to chromosome ideogram.

RCircos.Get.Gene.Label.Locations  
*Calculate New Position for Gene Labels*

### Description

This function calculates new plot position from genomic positions for gene labeling. In case there are too many genes in a genomic interval, the labels may become overlapped so that correct numbers and new plot positions are often needed to make the labels readable. This function will remove extra label data points if they cannot fit in the given genomic interval.

This function is for internal use only.

### Usage

```
RCircos.Get.Gene.Label.Locations(genomic.data)
```

### Arguments

`genomic.data` A data frame. The first three columns should be chromosome name, start position, end position.

### Value

A data frame containing same contents as the input `genomic.data` plus one column with RCircos plot positions.

### Author(s)

Hongen Zhang

---

RCircos.Get.Heatmap.ColorScales  
*Generate Color Scales for Heatmap Plot*

---

**Description**

Create color scales for heatmap plot. Currently there are six color scales could be generated:

BlueWhiteRed: colors from blue (lowest) to white then red (highest)  
 GreenWhiteRed: colors from green (lowest) to white then red (highest)  
 GreenYellowRed: colors from green (lowest) to yellow then red (highest)  
 GreenBlackRed: colors from green (lowest) to black then red (highest)  
 YellowToRed: colors from yellow (lowest) to red (highest)  
 BlackOnly: black only

This function is mainly for internal use only.

**Usage**

```
RCircos.Get.Heatmap.ColorScales(heatmap.color)
```

**Arguments**

<code>heatmap.color</code>	Character vector, one of "BlueWhiteRed", "GreenWhiteRed", "GreenYellowRed", "GreenBlackRed", "YellowToRed", and "BlackOnly".
----------------------------	---

**Value**

A vector or two column matrix of rgb colors.

**Author(s)**

Hongen Zhang

**Examples**

```
## Not run: colorScales <- RCircos.Get.Heatmap.ColorScales(heatmap.color);
```

---

RCircos.Get.Link.Colors  
*Set up Colors for Link Lines or Ribbons*

---

**Description**

Assign colors for link lines or Ribbons. The defult colors are rainbow with lenght of total link lines or ribbons. If by.chromosome is set to TRUE, red color will be used for links between positions of same chromosomes and blue color for links between different chromosomes. Users can also define their own colors by appending a column with color names to link data and give the column name as "PlotColor".

This function is for internal use only.

**Usage**

```
RCircos.Get.Link.Colors(link.data, by.chromosome)
```

**Arguments**

<code>link.data</code>	A data frame with paired genomic positions in each row. The first three columns are for chromosome names, start and end position of one genomic position followed by three columns for chromosome names, start and end position of the second genomic position.
<code>by.chromosome</code>	Logic. If true, red color will be used for links between positions of same chromosomes and blue color for links between different chromosomes. Otherwise, user defined or random colors (rainbow) will be automatically assigned for each line.

**Value**

A vector of color names with length same as the rows of input data.

**Author(s)**

Hongen Zhang

`RCircos.Get.Plot.Colors`  
*Assign Plot Colors for Non-Link Data Plot*

**Description**

Assign plot colors for each data point of genomic data except of link plot (link lines or ribbons). Users can define their own colors by appending a column with color names to plot data and give the column name as "PlotColor". Otherwise, default colors will be used.

This function is for internal use only.

**Usage**

```
RCircos.Get.Plot.Colors(plot.data, color)
```

**Arguments**

<code>plot.data</code>	A data frame with the first three columns as chromosome name, start and end position followed by data values for one or more samples.
<code>color</code>	Character vector of color names.

**Value**

A vector of color names with length same as the rows of input data.

**Author(s)**

Hongen Zhang

---

```
RCircos.Get.Plot.Data  
Convert Genomic Data to RCircos Plot Data
```

---

### Description

This function calculates the RCircos plot positions for genomic positions of the dataset. RCircos plot position is the row index of matrix that contains x- and y-coordinates of a circular line. A new column for RCircos plot positions is appended to the input genomic.data and returned.

This function is mainly for internal use.

### Usage

```
RCircos.Get.Plot.Data(genomic.data, plot.type)
```

### Arguments

genomic.data A data frame with the first three columns as chromosome name, start and end position followed by data values for one or more samples.  
plot.type Character vector, either "plot" or "link".

### Value

Updated genomic data (with a new column for RCircos plot positions)

### Author(s)

Hongen Zhang

---

---

```
RCircos.Get.Plot.Ideogram  
Get Chromosome Ideogram Object
```

---

### Description

Get the chromosome ideogram object used during current RCircos session. RCircos core components must be initialized first. This function is mainly for internal use.

### Usage

```
RCircos.Get.Plot.Ideogram()
```

### Value

A data frame containing all information for chromosome ideogram plot. The first five column are orginal cytoband data and following are chromosome highlight colors, and plot colors, length, number of chromosome unit, and relative location on the circular layout of each band.

### Author(s)

Hongen Zhang

---

RCircos.Get.Plot.Parameters  
Get All RCircos Plot Parameters

---

**Description**

Get all parameters used in current RCircos session in order to check and reset plot parameters.  
RCircos core components must be initialized first.

**Usage**

```
RCircos.Get.Plot.Parameters()
```

**Value**

A list of all parameters used for RCircos plot.

**Author(s)**

Hongen Zhang

**Examples**

```
# Load RCircos libaray

RCircos.Get.Plot.Positions  
*Get RCircos Plot Position Object*

---

## Description

Get the data frame of base plot positions which are used to derive all other positions of RCircos plot. RCircos core components must be initialized first. This function is mainly for internal use.

## Usage

```
RCircos.Get.Plot.Positions()
```

## Value

A data frame with three columns for x, and y coordinates of a circular line with radius of 1 as well as the degrees used for text rotation at each point of the positions.

## Author(s)

Hongen Zhang

## Examples

RCircos.Heatmap.Plot  
*Circos-like Heamap Plot*

---

**Description**

Draw one track of heatmap. RCircos core components and graphic device must be initialized before drawing.

**Usage**

```
RCircos.Heatmap.Plot(heatmap.data, data.col, track.num, side)
```

**Arguments**

<code>heatmap.data</code>	A data frame with the first three columns as chromosome names, start position and end position of each data point followed by data values for one or more samples.
<code>data.col</code>	Integer, representing the ordinal number of the column in input data set that contains the data to be plotted.
<code>track.num</code>	Integer, representing the ordinal number of the plot track where the heatmap will be plotted.
<code>side</code>	Character vector, either "in" or "out", representing the position related to chromosome ideogram.

 RCircos.Link.Plot *Circos-like Link Line Plot*

---

## Description

Draw lines (quadratic Bezier curves) between paired genomic positions. RCircos core components and graphic device must be initialize before drawing. Link lines are always in the center of plot area.

## Usage

```
RCircos.Link.Plot(link.data, track.num, by.chromosome = FALSE)
```

## Arguments

<code>link.data</code>	A data frame with paired genomic positions in each row. The first three columns are for chromosome names, start and end position of one genomic position followed by three columns for chromosome names, start and end position of the second genomic position.
<code>track.num</code>	Integer, representing the ordinal number of the plot track where the link lines will start.
<code>by.chromosome</code>	Logic. If true, red color will be used for links between positions of same chromosomes and blue color for links between different chromosomes. Otherwise, user defined or random colors (rainbow) will be automatically assigned for each line.

```

**Arguments**

<code>cyto.info.list</code>	A List contains data frames for chromosome ideogram data of different species. All data frames in the list must have same columns.
<code>species.list</code>	Character vector represent multiple species. Each one will be used as prefix of chromosome names for relevant species. The order of species must match the order of the species in <code>cyto.info.list</code> .
<code>chr.exclude</code>	Character vector of chromosome names to be excluded from plot, e.g., <code>chr.exclude &lt;- c("chrX", "chrY")</code> ;
<code>tracks.inside</code>	Integer, total number of data tracks inside of chromosome ideogram.
<code>tracks.outside</code>	Integer, total number of data tracks outside of chromosome ideogram.

## *Construct A Dataset from Multiple Genomic Data of Different Species*

## Description

Combine plot datasets from different species as one data frame for RCircos plot with multiple sets of chromosome ideogram.

## Usage

```
RCircos.Multiple.Species.Dataset(data.list, species)
```

## Arguments

`data.list` A List contains data frames for genomic data of different species. All data frames in the list must have same columns.

**species** Character vector represent multiple species. Each one will be used as prefix of chromosome names for relevant species. The order of species must match the order of the species in data.list.

## Value

A data frame contains all input plot data.

Reset RCircos Ideogram Plot Data
```

---

## Description

Reset chromosome ideogram plot data. Reserved for advanced usage.

## Usage

```
RCircos.Reset.Plot.Ideogram(chromIdeo)

## Description

Reset RCircos plot parameters after they were initialized. Also update chromosome ideogram and base positions when necessary. Among the parameters, chromosome padding is automatically calculated with `base.per.unit` unless the padding is set to zero. Parameters related to radius are automatically adjusted based on radius.

## Usage

```
RCircos.Reset.Plot.Parameters(new.params)

*RCircos.Ribbon.Plot*

*Draw Ribbon between Two Genomic Regions*

## Description

Draw various ribbons instead of lines with uniform thickness. The thickness of ribbons are relative to the size of the genomic regions to be linked.

## Usage

```
RCircos.Ribbon.Plot(ribbon.data, track.num, by.chromosome = FALSE, twist = FALSE)
```

## Arguments

- ribbon.data A data frame with paired genomic positions in each row. The first three columns of each row are for chromosome name, start and end positions of one genomic position followed by three columns for chromosome name, start and end positions of the second genomic position.
- track.num Integer, representing the ordinal number of the plot track where the ribbons will start.
- by.chromosome Logic, If true, red color will be used for ribbons between positions of same chromosomes and blue color for ribbons between different chromosomes. Otherwise, different colors will be automatically assigned for each ribbon.
- twist Logic, TRUE for the ribbons with twisted shape and FALSE for no twist.

**Usage**

```
RCircos.Scatter.Plot(scatter.data, data.col, track.num, side, by.fold = 0)
```

**Arguments**

scatter.data	A data frame with the first three columns as chromosome name, start position and end position of each data point followed by data values for one or more samples.
data.col	Integer, representing the ordinal number of the column in input dataset that contains the data to be plotted.
track.num	Integer, representing the ordinal number of the plot track where the data will be plotted.
side	Character vector, either "in" or "out", representing the position related to chromosome ideogram.
by.fold	Zero or a positive float number, if it is greater than zero, any data point with a value greater or equal to the by.fold will be plot as red color and data points with values less or equal to negative by.fold will be plot as blue colr. Otherwise, black color is used.

```

**Author(s)**

Hongen Zhang

**RCircos.Set.Core.Components**  
*Initialize Core Components for RCircos Plot*

**Description**

Setup core components for RCircos Plot including plot parameters, cytoband data, and base plot positions. This function must be called before chromosome ideogram and any other data plot.

**Usage**

```
RCircos.Set.Core.Components(cyto.info, chr.exclude = NULL,
                            tracks.inside, tracks.outside)
```

**Arguments**

- `cyto.info` A data frame with chromosome ideogram data and columns are ordered by chromosome names, start position, end position, band names, and stain intensity for each chromosome band.
- `chr.exclude` Character vector of chromosome names to be excluded from plot, e.g., `chr.exclude <- c("chrX", "chrY");`
- `tracks.inside` Integer, total number of data tracks inside of chromosome ideogram.
- `tracks.outside` Integer, total number of data tracks outside of chromosome ideogram.

`RCircos.Tile.Plot` *Circos-like Tile Plot*

## Description

Draw one track of Tiles. RCircos core components and graphics device must be initialized before drawing.

## Usage

```
RCircos.Tile.Plot(tile.data, track.num, side)
```

## Arguments

<code>tile.data</code>	A data frame with three columns for chromosome name, start and end positions of each data point. Columns for data values are optional.
<code>track.num</code>	Integer, representing the ordinal number of the plot track where the data will be plotted.
<code>side</code>	Character vector, either "in" or "out", representing the position related to chromosome ideogram.

## Author(s)

Hongen Zhang

## Examples

```

**RCircos.Track.Outline***Draw Outline for A Data Plot Track***Description**

Draw outline with subtracks for one data plot track. RCircos core components and graphic device must be initialized first. This function is mainly for internal use.

**Usage**

```
RCircos.Track.Outline(out.pos, in.pos, num.layers)
```

**Arguments**

<code>out.pos</code>	Float number, the outside position of a data track.
<code>in.pos</code>	Float number, the inside position of a data track.
<code>num.layers</code>	Integer, total number of subtrack in a data plot track.

## Examples

---

**RCircos.Track.Positions**  
*Calculate Data Plot Track Positions*

---

**Description**

Calculate inner and outer plot positions for a data track. RCircos core components must be initialized first. This function is for internal use only.

**Usage**

```
RCircos.Track.Positions(side, track.num)
```

**Arguments**

side	Character vector, either "in" or "out", representing the position related to chromosome ideogram.
track.num	Integer, representing the ordinal number of the plot track

---

**RCircos.Validate.Cyto.Info**  
*Validate Chromosome Ideogram Data*

---

**Description**

Validate chromosome ideogram information including of chromosome names, order of chromosomes, chromosome start and chromosome end positions for each chromosome band. This function is mainly for internal use.

**Usage**

```
RCircos.Validate.Cyto.Info(cyto.info, chr.exclude)
```

**Arguments**

cyto.info	A data frame with chromosome ideogram data includes chromosome names, start position, end position, band names, and stain intensity for each chromosome band.
chr.exclude	Character vector of chromosome names to be excluded from plot, e.g., chr.exclude <- c("chrX", "chrY");

**Value**

Data frame with validated chromosome ideogram information.

**Author(s)**

Hongen Zhang

---

```
RCircos.Validate.Genomic.Data
    Validate Genomic Data for RCircos Plot
```

---

## Description

Validate input dataset for correct chromosome names, chromosome start, and chromosome end positions. Chromosome names will be converted to character vectors if they are factor variables. This function is for internal use.

## Usage

```
RCircos.Validate.Genomic.Data(genomic.data, plot.type = c("plot", "link"))
```

## Arguments

genomic.data A data frame with the first three columns as chromosome names, start and end positions. Following columns may be another set of chromosome names, start and end positions then zero or more data columns.  
plot.type Character vector either "plot" for dataset with one set of genomic position data or "link" for dataset with paired genomic position data .

## Value

The validated data frame.

---

```
RCircos.Workflow      Print Out RCircos Workflow
```

---

## Description

Display RCircos plot workflow on standard output device for a quick guide.

## Usage

```
