## 1 Overview

The software **augmentedRCBD** is built on the **R** statistical programming language as an add-on (or ‘package’ in the **R** *lingua franca*). It performs the analysis of data generated from experiments in augmented randomised complete block design according to Federer, W.T. (1956a, 1956b, 1961; 1976). It also computes analysis of variance, adjusted means, descriptive statistics, genetic variability statistics etc. and includes options for data visualization and report generation.

This tutorial aims to educate the users in utilising this package for performing such analysis. Utilising **augmentedRCBD** for data analysis requires a basic knowledge of **R** programming language. However, as many of the intended end-users may not be familiar with **R**, sections 2 to 4 give a ‘gentle’ introduction to **R**, especially those aspects which are necessary to get **augmentedRCBD** up and running for performing data analysis in a Windows environment. Users already familiar with **R** can feel free to skip to section 5.

## 2 R software

It is a free software environment for statistical computing and graphics. It is free and open source, platform independent (works on Linux, Windows or MacOS), very flexible, comprehensive with robust interfaces for all the popular programming languages as well as databases. It is strengthened by its diverse library of add-on packages extending its ability as well as the incredible community support. It is one of the most popular tools being used in academia today (Tippmann, 2015).

## 3 Getting Started

This section details the steps required to set up the **R** programming environment under a third-party interface called **RStudio** in Windows.

### 3.1 Installing R

Download and install **R** for Windows from <http://cran.r-project.org/bin/windows/base/>.

If you want to double-check that the package you have downloaded matches the package distributed by CRAN, you can compare the [md5sum](#) of the .exe to the [fingerprint](#) on the master server. You will need a version of md5sum for windows: both [graphical](#) and [command line versions](#) are available.

#### Frequently asked questions

- [Does R run under my version of Windows?](#)
- [How do I update packages in my previous version of R?](#)
- [Should I run 32-bit or 64-bit R?](#)

Please see the [R FAQ](#) for general information about R and the [R Windows FAQ](#) for Windows-specific information.

#### Other builds

- Patches to this release are incorporated in the [r-patched snapshot build](#).
- A build of the development version (which will eventually become the next major release of R) is available in the [r-devel snapshot build](#).
- [Previous releases](#)

Note to webmasters: A stable link which will redirect to the current Windows binary release is  
<<CRAN MIRROR>/bin/windows/base/release.htm>.

---

Last change: 2018-07-02

**Fig. 1:** The **R** download location.

### 3.2 Installing RStudio

The basic command line interface in native **R** is rather limiting. There are several interfaces which enhance its functionality and ease of use, **RStudio** being one of the most popular among **R** programmers.

Download and install **RStudio** for Windows from <https://www.rstudio.com/products/rstudio/download/#download>

### Installers for Supported Platforms

| Installers   | Size    | Date       | MD5                              |
|--|---------|------------|----------------------------------|
| RStudio 1.1.456 - Windows Vista/7/8/10                         | 85.8 MB | 2018-07-19 | 24ca3fe0dad8187aab4bfbb9dc2b5ad  |
| RStudio 1.1.456 - Mac OS X 10.6+ (64-bit)                      | 74.5 MB | 2018-07-19 | 4fc4f4f70845b142bf96dc1a5b1dc556 |
| RStudio 1.1.456 - Ubuntu 12.04-15.10/Debian 8 (32-bit)         | 89.3 MB | 2018-07-19 | 3493f9d5839e3a3d697f40b7bb1ce961 |
| RStudio 1.1.456 - Ubuntu 12.04-15.10/Debian 8 (64-bit)         | 97.4 MB | 2018-07-19 | 863ae806120358fa0146e4d14cd75be4 |
| RStudio 1.1.456 - Ubuntu 16.04+/Debian 9+ (64-bit)             | 64.9 MB | 2018-07-19 | d96e63548c2add890bac633bdb883f32 |
| RStudio 1.1.456 - Fedora 19+/RedHat 7+/openSUSE 13.1+ (32-bit) | 88.1 MB | 2018-07-19 | 1df56c7cd80e2634f8a9fdd11ca1fb2d |
| RStudio 1.1.456 - Fedora 19+/RedHat 7+/openSUSE 13.1+ (64-bit) | 90.6 MB | 2018-07-19 | 5e77094a88fdbddddd0d35708752462  |

### Zip/Tarballs

| Zip/tar archives   | Size     | Date       | MD5                              |
|--|----------|------------|----------------------------------|
| RStudio 1.1.456 - Windows Vista/7/8/10                         | 122.9 MB | 2018-07-19 | 659d6bfe716d8c97acbe501270d89fa3 |
| RStudio 1.1.456 - Ubuntu 12.04-15.10/Debian 8 (32-bit)         | 90 MB    | 2018-07-19 | 63117c159deca4d01221a8069bd45373 |
| RStudio 1.1.456 - Ubuntu 12.04-15.10/Debian 8 (64-bit)         | 98.3 MB  | 2018-07-19 | c53c32a71a400c6571e36c573f83dfde |
| RStudio 1.1.456 - Fedora 19+/RedHat 7+/openSUSE 13.1+ (32-bit) | 88.8 MB  | 2018-07-19 | f4ba2509fb00e30c91414c6821f1c85f |
| RStudio 1.1.456 - Fedora 19+/RedHat 7+/openSUSE 13.1+ (64-bit) | 91.4 MB  | 2018-07-19 | c60db6467421aa86c772227da0945a13 |

### Source Code

A tarball containing source code for RStudio v1.1.456 can be downloaded from [here](#)

**Fig. 2:** The **RStudio** download location.

### 3.3 The **RStudio** Interface

On opening **RStudio**, the default interface with four panes/windows is visible as follows. Few panes have different tabs.

**Fig. 3:** The default **RStudio** interface with the four panes.

### 3.3.1 Console

This is where the action happens. Here any authentic **R** code typed after the '`>`' prompt will be executed after pressing 'Enter' to generate the output.

For example, type `1+1` in the console and press 'Enter'.

```
1+1
```

```
[1] 2
```

### 3.3.2 Source

This is where **R** Scripts (collection of code) can be created and edited. **R** scripts are text files with a `.R` extension. **R** Code for analysis can be typed and saved in such **R** scripts. New scripts can be opened by clicking 'File|New File' and selecting 'R Script'. Code can be selected from **R** Scripts and sent to console for evaluation by clicking 'Run' on the 'Source' pane or by pressing 'Ctrl + Enter'.

### 3.3.3 Environment|History|Connections

The 'Environment' tab shows the list of all the 'objects' (see section 4.3) defined in the current **R** session. It has also some buttons up top to open, save and clear the environment as well as few options for import of data under **Import Dataset**.

The 'History' tab shows a history of all the code that was previously evaluated. This is useful, if you want to go back to some code.

The ‘Connections’ tab helps to establish and manage connections with different databases and data sources.

#### 3.3.4 Files|Plots|Packages|Help|Viewer

The ‘Files’ tab shows a sleek file browser to access the file directory in the computer with options to manage the working directory (see section 4.1) under the More button.

The ‘Plots’ tab shows all the plots generated in **R** with buttons to delete unnecessary ones and export useful ones as a pdf file or as an image file.

The ‘Packages’ tab shows a list of all the **R** add-on packages installed. The check box on the left shows whether they are loaded or not. There are also buttons to install and update **R** packages.

The ‘Viewer’ tab shows any web content output generated by an **R** code.

## 4 Some Basics

This section describes some basics to enable the users to have a working knowledge in **R** in order to use **augmentedRCBD**.

### 4.1 Working Directory

It is a file path to a folder on the computer which is recognised by **R** as the default location to read files from or write files to. The code **getwd()** shows the current working directory, while **setwd()** can be used to change the existing working directory.

```
# Print current working directory
getwd()
```

```
[1] "C:/Users/Computer/Documents"
```

```
# Set new working directory
setwd("C:/Data Analysis/")
getwd()
```

```
[1] "C:/Data Analysis/"
```

One key detail is that file paths in **R** uses forward slashes (/) as in MacOS or Linux, unlike backward slashes (\) in Windows. This needs to be considered while copying paths from default Windows file explorer.

### 4.2 Expression and Assignment

Expressions are instructions in the form of code to be entered after the > prompt in the console. Expressions can be a constant, an arithmetic or a condition. A more advanced and most useful expression is a function call (see section 4.3).

```
# Constant
123
```

```
[1] 123
```

```
# Arithmetic (add two numbers)
1 + 2
```

```
[1] 3
```

```
# Condition
34 > 25

[1] TRUE

1 == 2

[1] FALSE

# Function call (mean of a series of numbers)
mean(c(25, 56, 89, 35))

[1] 51.25
```

Information from an expression can be stored as an ‘object’ (see section 4.3) by assigning a name using the operator ‘`<-`’.

```
# Assign the result of the expression 1 + 2 to an object 'a'
a <- 1 + 2
a
```

```
[1] 3
```

It is recommended to add comments to explain the code by using the ‘`#`’ sign. Any code after the ‘`#`’ sign will be ignored by **R**.

## 4.3 Objects and Functions

**R** is an object-oriented programming language (OOP). Any kind or construct created in **R** is an ‘object’. Each object has a ‘class’ (shown using the `class()` function) and different ‘attributes’ which defines what operations can be done on that object. There are different types of data structure objects in **R** such as vectors, matrices, factors, data frames, and lists. A ‘function’ is also an object, which defines a procedure or a sequence of expressions.

### 4.3.1 Vector

A vector is a collection of elements of a single type (or ‘mode’). The common vector modes are ‘numeric’, ‘integer’, ‘character’ and ‘logical’. The `c()` function is used to create vectors. The functions `class()`, `str()` and `length()` show the attributes of vectors.

Vector modes ‘numeric’ stores real numbers, while ‘integer’ stores integers, which can be enforced by suffixing elements with ‘`L`’.

```
# A numeric vector
a <- c(1, 2, 3.3)
class(a)

[1] "numeric"

str(a)

num [1:3] 1 2 3.3
length(a)

[1] 3

# An integer vector
b <- c(1L, 2L, 3L)
class(b)
```

```
[1] "integer"
str(b)

int [1:3] 1 2 3
length(b)

[1] 3
```

The vector mode ‘character’ store text.

```
# A character vector
c <- c("one", "two", "three")
class(c)

[1] "character"
str(c)

chr [1:3] "one" "two" "three"
length(c)
```

```
[1] 3
```

The vector mode ‘logical’ stores ‘TRUE’ OR ‘FALSE’ logical data.

```
#logical vector
d <- c(TRUE, TRUE, TRUE, FALSE, TRUE, FALSE)
class(d)

[1] "logical"
str(d)

logi [1:6] TRUE TRUE TRUE FALSE TRUE FALSE
length(d)
```

```
[1] 6
```

### 4.3.2 Factor

A ‘factor’ in R stores data from categorical data in variables as different levels.

```
catg <- c("male", "female", "female", "male", "male")
catg

[1] "male"    "female"   "female"   "male"     "male"
is.factor(catg)

[1] FALSE
# Apply the factor function
factor_catg <- factor(catg)

factor_catg

[1] male    female   female   male    male
Levels: female male
```

```

is.factor(factor_catg)

[1] TRUE
class(factor_catg)

[1] "factor"
str(factor_catg)

Factor w/ 2 levels "female","male": 2 1 1 2 2

A character, numeric or integer vector can be transformed to a factor by using the as.factor() function.

# Conversion of numeric to factor
a <- c(1, 2, 3.3)
class(a)

[1] "numeric"
str(a)

num [1:3] 1 2 3.3
fac_a <- as.factor(a)
class(fac_a)

[1] "factor"
str(fac_a)

Factor w/ 3 levels "1","2","3.3": 1 2 3

# Conversion of integer to factor
b <- c(1L, 2L, 3L)
class(b)

[1] "integer"
str(b)

int [1:3] 1 2 3
fac_b <- as.factor(b)
class(fac_b)

[1] "factor"
str(fac_b)

Factor w/ 3 levels "1","2","3": 1 2 3

# Conversion of character to factor
c <- c("one", "two", "three")
class(c)

[1] "character"
str(c)

chr [1:3] "one" "two" "three"

```

```

fac_c <- as.factor(c)
class(fac_c)

[1] "factor"
str(fac_c)

Factor w/ 3 levels "one","three",...: 1 3 2

```

### 4.3.3 Matrix

A ‘matrix’ in R is a vector with the attributes ‘`nrow`’ and ‘`ncol`’.

```

# Generate 5 * 4 numeric matrix
m <- matrix(1:20, nrow = 5, ncol = 4)
m

```

```

[,1] [,2] [,3] [,4]
[1,]    1    6   11   16
[2,]    2    7   12   17
[3,]    3    8   13   18
[4,]    4    9   14   19
[5,]    5   10   15   20

```

```
class(m)
```

```

[1] "matrix" "array"
typeof(m)

```

```

[1] "integer"
# Dimensions of m
dim(m)

```

```
[1] 5 4
```

### 4.3.4 List

A ‘list’ is a container containing different objects. The contents of list need not be of the same type or mode. A list can encompass a mixture of data types such as vectors, matrices, data frames, other lists or any other data structure.

```

w <- list(a, m, d, list(b, c))
class(w)

```

```

[1] "list"
str(w)

List of 4
$ : num [1:3] 1 2 3.3
$ : int [1:5, 1:4] 1 2 3 4 5 6 7 8 9 10 ...
$ : logi [1:6] TRUE TRUE TRUE FALSE TRUE FALSE
$ :List of 2
..$ : int [1:3] 1 2 3
..$ : chr [1:3] "one" "two" "three"

```

### 4.3.5 Data Frame

A ‘data frame’ in **R** is a special kind of list with every element having equal length. It is very important for handling tabular data in **R**. It is a array like structure with rows and columns. Each column needs to be of a single data type, however data type can vary between columns.

```
L <- LETTERS[1:4]
y <- 1:4
z <- c("This", "is", "a", "data frame")
df <- data.frame(L, x = 1, y, z)
df
```

```
L x y           z
1 A 1 1         This
2 B 1 2         is
3 C 1 3         a
4 D 1 4 data frame
```

```
str(df)
```

```
'data.frame': 4 obs. of 4 variables:
 $ L: chr  "A" "B" "C" "D"
 $ x: num  1 1 1 1
 $ y: int  1 2 3 4
 $ z: chr  "This" "is" "a" "data frame"
```

```
attributes(df)
```

```
$names
[1] "L" "x" "y" "z"
```

```
$class
[1] "data.frame"
```

```
$row.names
[1] 1 2 3 4
```

```
rownames(df)
```

```
[1] "1" "2" "3" "4"
```

```
colnames(df)
```

```
[1] "L" "x" "y" "z"
```

### 4.3.6 Functions

All of the work in **R** is done by functions. It is an object defining a procedure which takes one or more objects as input (or ‘arguments’), performs some action on them and finally gives a new object as output (or ‘return’). **class()**, **mean()**, **getwd()**, **+**, etc. are all functions.

For example the function **mean()** takes a numeric vector as argument and returns the mean as a numeric vector.

```
a <- c(1, 2, 3.3)
mean(a)
```

```
[1] 2.1
```

The user can also create custom functions. For example the function `foo` adds two numbers and gives the result.

```
foo <- function(n1, n2) {
  out <- n1 + n2
  return(out)
}
foo(2, 3)
```

```
[1] 5
```

## 4.4 Special Elements

In addition to numbers and text, there are some special elements which can be included in different data objects.

**NA** (not available) indicates missing data.

```
x <- c(2.5, NA, 8.6)
y <- c(TRUE, FALSE, NA)
z <- c("k", NA, "m", "n", "o")
is.na(x)
```

```
[1] FALSE TRUE FALSE
```

```
is.na(z)
```

```
[1] FALSE TRUE FALSE FALSE FALSE
```

```
anyNA(x)
```

```
[1] TRUE
```

```
a
```

```
[1] 1.0 2.0 3.3
```

```
is.na(a)
```

```
[1] FALSE FALSE FALSE
```

**Inf** indicates infinity.

```
1/0
```

```
[1] Inf
```

**NaN** (Not a Number) indicates any undefined value.

```
0/0
```

```
[1] NaN
```

## 4.5 Indexing

The `[` function is used to extract elements of an object by indexing (numeric or logical). Named elements in lists and data frames can be extracted by using the `$` operator.

Consider a vector `a`.

```
a <- c(1, 2, 3.3, 2.8, 6.7)
# Numeric indexing
# Extract first element
a[1]
```

```

## 4.6 Help Documentation

The help documentation regarding any function can be viewed using the `?` or `help()` function. The help documentation shows the default usage of the function including, the arguments that are taken by the function and the type of output object returned ('Value').

```
?ls
help(ls)

?mean

?setwd
```

## 4.7 Packages

Packages in **R** are collections of **R** functions, data, and compiled code in a well-defined format. They are add-ons which extend the functionality of **R** and at present, there are 19555 packages available for deployment and use at the official repository, the Comprehensive R Archive Network (CRAN).

Valid packages from CRAN can be installed by using the `install.packages()` command.

```
# Install the package 'readxl' for importing data from excel
install.packages(readxl)
```

Installed packages can be loaded using the function `library()`.

```
# Install the package 'readxl' for importing data from excel
library(readxl)
```

## 4.8 Importing and Exporting Tabular Data

Tabular data from a spreadsheet can be imported into **R** in different ways. Consider some data such as in Table 1. Copy this data in to a spreadsheet editor such as MS Excel and save it as `augdata.csv`, a comma-separated-value file and `augdata.xlsx`, an Excel file in the working directory (`getwd()`).

**Table 1:** Example data from an experiment in augmented RCBD design.

| blk | trt | y1 | y2  |
|-----|-----|----|-----|
| I   | 1   | 92 | 258 |
| I   | 2   | 79 | 224 |
| I   | 3   | 87 | 238 |
| I   | 4   | 81 | 278 |
| I   | 7   | 96 | 347 |
| I   | 11  | 89 | 300 |
| I   | 12  | 82 | 289 |
| II  | 1   | 79 | 260 |
| II  | 2   | 81 | 220 |
| II  | 3   | 81 | 237 |
| II  | 4   | 91 | 227 |
| II  | 5   | 79 | 281 |
| II  | 9   | 78 | 311 |
| III | 1   | 83 | 250 |
| III | 2   | 77 | 240 |
| III | 3   | 78 | 268 |
| III | 4   | 78 | 287 |
| III | 8   | 70 | 226 |
| III | 6   | 75 | 395 |
| III | 10  | 74 | 450 |

The **augdata.csv** file can be imported into **R** using the **read.csv()** function or the **read\_csv()** function in the **readr** package.

```
data <- read.csv(file = "augdata.csv")
str(data)

'data.frame': 20 obs. of 4 variables:
 $ blk: Factor w/ 3 levels "I","II","III": 1 1 1 1 1 1 1 2 2 2 ...
 $ trt: num 1 2 3 4 7 11 12 1 2 3 ...
 $ y1 : num 92 79 87 81 96 89 82 79 81 81 ...
 $ y2 : num 258 224 238 278 347 300 289 260 220 237 ...
```

The argument **stringsAsFactors = FALSE** reads the text columns as of type **character** instead of the default **factor**.

```
data <- read.csv(file = "augdata.csv", stringsAsFactors = FALSE)
str(data)

'data.frame': 20 obs. of 4 variables:
 $ blk: chr "I" "I" "I" "I" ...
 $ trt: num 1 2 3 4 7 11 12 1 2 3 ...
 $ y1 : num 92 79 87 81 96 89 82 79 81 81 ...
 $ y2 : num 258 224 238 278 347 300 289 260 220 237 ...
```

The **augdata.xlsx** file can be imported into **R** using the **read\_excel()** function in the **readxl** package.

```
library(readxl)
data <- read_excel(path = "augdata.xlsx")

'data.frame': 20 obs. of 4 variables:
 $ blk: chr "I" "I" "I" "I" ...
```

```
$ trt: num  1 2 3 4 7 11 12 1 2 3 ...
$ y1 : num  92 79 87 81 96 89 82 79 81 81 ...
$ y2 : num  258 224 238 278 347 300 289 260 220 237 ...
```

The tabular data can be exported from **R** to a **.csv** (comma-separated-value) file by the **write.csv()** function.

```
write.csv(x = data, file = "augdata.csv")
```

## 4.9 Additional Resources

To learn more about **R**, there are umpteen number of online tutorials as well as free courses available. Queries about various aspects can be put to the active and vibrant ‘R’ community online.

- Online tutorials
  - <http://www.cran.r-project.org/other-docs.html>
  - <https://bookdown.org/ndphillips/YaRrr/>
- Free online courses
  - <http://tryr.codeschool.com/>
  - <https://www.datacamp.com/courses/free-introduction-to-r>
- R community support
  - <http://stackoverflow.com/>
  - R help mailing lists : <http://www.r-project.org/mail.html>

## 5 Installation of **augmentedRCBD**

The package **augmentedRCBD** can be installed using the following functions.

```
# Install from CRAN
install.packages('augmentedRCBD', dependencies=TRUE)

# Install development version from Github
if (!require('devtools')) install.packages('devtools')
library(devtools)
install_github("aravind-j/augmentedRCBD")
```

The stable release is hosted in CRAN (see section 4.7), while the under-development version is hosted as a Github repository. To install from github, you need to use the **install\_github()** function from ‘devtools’ package.

Then the package can be loaded using the function

```
library(augmentedRCBD)
```

---

```
Welcome to augmentedRCBD version 0.1.6
```

```
# To know how to use this package type:
browseVignettes(package = 'augmentedRCBD')
for the package vignette.

# To know what's new in this version type:
news(package='augmentedRCBD')
```

---

```

for the NEWS file.

# To cite the methods in the package type:
citation(package='augmentedRCBD')

# To suppress this message use:
suppressPackageStartupMessages(library(augmentedRCBD))

```

---

The current version of the package is 0.1.6. The previous versions are as follows.

**Table 2.** Version history of **augmentedRCBD R** package.

| Version | Date       |
|---------|------------|
| 0.1.0   | 2018-07-10 |
| 0.1.1   | 2019-07-21 |
| 0.1.2   | 2020-03-19 |
| 0.1.3   | 2020-07-27 |
| 0.1.4   | 2021-02-17 |

To know detailed history of changes use `news(package='augmentedRCBD')`.

## 6 Data Format

Certain details need to be considered for arranging experimental data for analysis using the **augmentedRCBD** package.

The data should be in long/vertical form, where each row has the data from one genotype per block. For example, consider the following data (Table 3) recorded for a trait from an experiment laid out in an augmented block design with 3 blocks and 12 genotypes(or treatment) with 6 to 7 genotypes/block. 8 genotypes (Test, G 5 to G 12) are not replicated, while 4 genotypes (Check, G 1 to G 4) are replicated.

**Table 3:** Data from an experiment in augmented RCBD design.

| Block I   | G12       | G4        | G11       | G2        | G1        | G7        | G3        |
|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
|           | 82        | 81        | 89        | 79        | 92        | 96        | 87        |
| Block II  | G5        | G9        | –         | <b>G3</b> | <b>G1</b> | <b>G2</b> | <b>G4</b> |
|           | 79        | 78        | –         | 81        | 79        | 81        | 91        |
| Block III | <b>G4</b> | <b>G2</b> | <b>G1</b> | G6        | G10       | <b>G3</b> | G8        |
|           | 78        | 77        | 83        | 75        | 74        | 78        | 70        |

This data needs to be arranged with columns showing block, genotype (or treatment) and the data of the trait for each genotype per block (Table 4).

**Table 4:** Data from an experiment in augmented RCBD design arranged in long-form.

| Block   | Treatment | Trait |
|---------|-----------|-------|
| Block I | G 1       | 92    |
| Block I | G 2       | 79    |
| Block I | G 3       | 87    |

| Block     | Treatment | Trait |
|-----------|-----------|-------|
| Block I   | G 4       | 81    |
| Block I   | G 7       | 96    |
| Block I   | G 11      | 89    |
| Block I   | G 12      | 82    |
| Block II  | G 1       | 79    |
| Block II  | G 2       | 81    |
| Block II  | G 3       | 81    |
| Block II  | G 4       | 91    |
| Block II  | G 5       | 79    |
| Block II  | G 9       | 78    |
| Block III | G 1       | 83    |
| Block III | G 2       | 77    |
| Block III | G 3       | 78    |
| Block III | G 4       | 78    |
| Block III | G 8       | 70    |
| Block III | G 6       | 75    |
| Block III | G 10      | 74    |

The data for block and genotype (or treatment) can also be depicted as numbers (Table 5).

**Table 5:** Data from an experiment in augmented RCBD design arranged in long-form (Block and Treatment as numbers).

| Block | Treatment | Trait |
|-------|-----------|-------|
| 1     | 1         | 92    |
| 1     | 2         | 79    |
| 1     | 3         | 87    |
| 1     | 4         | 81    |
| 1     | 7         | 96    |
| 1     | 11        | 89    |
| 1     | 12        | 82    |
| 2     | 1         | 79    |
| 2     | 2         | 81    |
| 2     | 3         | 81    |
| 2     | 4         | 91    |
| 2     | 5         | 79    |
| 2     | 9         | 78    |
| 3     | 1         | 83    |
| 3     | 2         | 77    |
| 3     | 3         | 78    |
| 3     | 4         | 78    |
| 3     | 8         | 70    |
| 3     | 6         | 75    |
| 3     | 10        | 74    |

Multiple traits can be added as additional columns (Table 6).

**Table 6:** Data from an experiment in augmented RCBD design arranged in long-form (Multiple traits).

| Block     | Treatment | Trait1 | Trait2 |
|-----------|-----------|--------|--------|
| Block I   | G 1       | 92     | 258    |
| Block I   | G 2       | 79     | 224    |
| Block I   | G 3       | 87     | 238    |
| Block I   | G 4       | 81     | 278    |
| Block I   | G 7       | 96     | 347    |
| Block I   | G 11      | 89     | 300    |
| Block I   | G 12      | 82     | 289    |
| Block II  | G 1       | 79     | 260    |
| Block II  | G 2       | 81     | 220    |
| Block II  | G 3       | 81     | 237    |
| Block II  | G 4       | 91     | 227    |
| Block II  | G 5       | 79     | 281    |
| Block II  | G 9       | 78     | 311    |
| Block III | G 1       | 83     | 250    |
| Block III | G 2       | 77     | 240    |
| Block III | G 3       | 78     | 268    |
| Block III | G 4       | 78     | 287    |
| Block III | G 8       | 70     | 226    |
| Block III | G 6       | 75     | 395    |
| Block III | G 10      | 74     | 450    |

Data should preferably be balanced i.e. all the check genotypes should be present in all the blocks. If not, a warning is issued. The number of test genotypes can vary within a block. There should not be any missing values. Rows of genotypes with missing values for one or more traits should be removed.

Such a tabular data should be imported (see section 7.8) into **R** as a data frame object (see section 4.3.5). The columns with the block and treatment categorical data should of the type factor (see section 4.3.2), while the column(s) with the trait data should be of the type integer or numeric (see section 4.3.1).

## 7 Data Analysis for a Single Trait

Analysis of data for a single trait can be performed by using **augmentedRCBD** function. It generates an object of class **augmentedRCBD**. Such an object can then be taken as input by the several functions to print the results to console (**print.augmentedRCBD**), generate descriptive statistics from adjusted means (**describe.augmentedRCBD**), plot frequency distribution (**freqdist.augmentedRCBD**) and computed genetic variability statistics (**gva.augmentedRCBD**). All these outputs can also be exported as a MS Word report using the **report.augmentedRCBD** function.

**Fig. 4.** Workflow for analysis of single traits with `augmentedRCBD`.

### 7.1 `augmentedRCBD()`

Consider the data in Table 1. The data can be imported into **R** as vectors as follows.

```

blk <- c(1, 1, 1, 1, 1, 1, 2, 2, 2, 2, 2, 3, 3, 3, 3, 3, 3)
trt <- c(1, 2, 3, 4, 7, 11, 12, 1, 2, 3, 4, 5, 9, 1, 2, 3, 4, 8, 6, 10)
y1 <- c(92, 79, 87, 81, 96, 89, 82, 79, 81, 81, 91, 79, 78, 83, 77, 78, 78,
        70, 75, 74)
y2 <- c(258, 224, 238, 278, 347, 300, 289, 260, 220, 237, 227, 281, 311, 250,
        240, 268, 287, 226, 395, 450)
  
```

The `blk` and `trt` vectors with the block and treatment data need to be converted into factors as follows before analysis.

```

# Convert block and treatment to factors
blk <- as.factor(blk)
trt <- as.factor(trt)
  
```

With the data in appropriate format, the analysis can be performed as follows for the trait `y1` as follows.

```

out1 <- augmentedRCBD(blk, trt, y1, method.comp = "lsd",
                      alpha = 0.05, group = TRUE, console = TRUE)
  
```

#### Augmented Design Details =====

class(out1)

[1] "augmentedRCBD"

Similarly the analysis for the trait **y2** can be computed as follows.

```
out2 <- augmentedRCBD(blk, trt, y2, method.comp = "lsd",
                      alpha = 0.05, group = TRUE, console = TRUE)
```

**Augmented Design Details****=====**

```
Number of blocks      "3"
Number of treatments "12"
Number of check treatments "4"
Number of test treatments "8"
Check treatments      "1, 2, 3, 4"
```

**ANOVA, Treatment Adjusted****=====**

```

```
class(out2)
```

```
[1] "augmentedRCBD"
```

The data can also be imported as a data frame and then used for analysis. Consider the data frame **data** imported from Table 1 according to the instructions in section 4.8.

```
str(data)
```

```

'data.frame': 20 obs. of 4 variables:
$ blk: Factor w/ 3 levels "1","2","3": 1 1 1 1 1 1 1 2 2 2 ...
$ trt: Factor w/ 12 levels "1","2","3","4",...: 1 2 3 4 7 11 12 1 2 3 ...
$ y1 : num  92 79 87 81 96 89 82 79 81 81 ...
$ y2 : num  258 224 238 278 347 300 289 260 220 237 ...

# Convert block and treatment to factors
data$blk <- as.factor(data$blk)
data$trt <- as.factor(data$trt)

# Results for variable y1
out1 <- augmentedRCBD(data$blk, data$trt, data$y1, method.comp = "lsd",
                        alpha = 0.05, group = TRUE, console = TRUE)

```

#### Augmented Design Details

```
=====
```

```

Number of blocks          "3"
Number of treatments      "12"
Number of check treatments "4"
Number of test treatments "8"
Check treatments          "1, 2, 3, 4"

```

#### ANOVA, Treatment Adjusted

class(out2)

[1] "augmentedRCBD"

Check genotypes are inferred by default on the basis of number of replications. However, if some test genotypes are also replicated, they may also be falsely detected as checks. To avoid this, the checks can be specified by the **checks** argument.

```
# Results for variable y1 (checks specified)
out1 <- augmentedRCBD(data$blk, data$trt, data$y1, method.comp = "lsd",

| 10 | 437.67 | 18.27 | 6 | 392.95 | 482.38 | 7  |

In case the large number of treatments or genotypes, it is advisable to avoid treatment comparisons with the `group = FALSE` argument as it will be memory and processor intensive. Further it is advised to simplify output with `simplify = TRUE` in order to reduce output object size.

If `truncate.means = TRUE`, then any negative adjusted means will be truncated to zero with a warning.

## 7.2 `print.augmentedRCBD()`

The results of analysis in an object of class `augmentedRCBD` can be printed to the console as follows.

```
# Print results for variable y1
print(out1)
```

### Augmented Design Details

---

```
Number of blocks      "3"
Number of treatments "12"
Number of check treatments "4"
Number of test treatments "8"
Check treatments      "1, 2, 3, 4"
```

### ANOVA, Treatment Adjusted

| 11        | 299.42         | 18.27 | 6  | 254.70   | 344.13   | 45    |
| 9         | 323.92         | 18.27 | 6  | 279.20   | 368.63   | 56    |
| 7         | 346.42         | 18.27 | 6  | 301.70   | 391.13   | 56    |
| 6         | 382.67         | 18.27 | 6  | 337.95   | 427.38   | 67    |
| 10        | 437.67         | 18.27 | 6  | 392.95   | 482.38   | 7     |

**7.3 `describe.augmentedRCBD()`**

The descriptive statistics such as count, mean, standard error, minimum, maximum, skewness (with p-value from D'Agostino test of skewness (D'Agostino (1970))) and kurtosis (with p-value from Anscombe-Glynn test of kurtosis (Anscombe and Glynn (1983))) for the adjusted means from the results in an object of class `augmentedRCBD` can be computed as follows.

```
# Descriptive statistics for variable y1  
describe.augmentedRCBD(out1)
```

```
$Count  
[1] 12  
  
$Mean  
[1] 81.0625  
  
$Std.Error  
[1] 1.547002  
  
$Std.Deviation  
[1] 5.358973  
  
$Min  
[1] 73.25

[1] 0.5913975
```

#### 7.4 freqdist.augmentedRCBD()

The frequency distribution of the adjusted means from the results in an object of class **augmentedRCBD** can be plotted as follows.

```
# Frequency distribution for variable y1
freq1 <- freqdist.augmentedRCBD(out1, xlab = "Trait 1")
```

```
Warning: Removed 2 rows containing missing values (`geom_bar()`).
plot(freq1)
```

```
# Frequency distribution for variable y2
freq2 <- freqdist.augmentedRCBD(out2, xlab = "Trait 2")
```

```
Warning: Removed 2 rows containing missing values (`geom_bar()`).
plot(freq2)
```

The colours for the check values may be specified using the argument `check.col`.

```
colset <- c("red3", "green4", "purple3", "darkorange3")

# Frequency distribution for variable y1
freq1 <- freqdist.augmentedRCBD(out1, xlab = "Trait 1", check.col = colset)
```

```
Warning: Removed 2 rows containing missing values (`geom_bar()`).
plot(freq1)
```

```
# Frequency distribution for variable y2
freq2 <- freqdist.augmentedRCBD(out2, xlab = "Trait 2", check.col = colset)
```

```
Warning: Removed 2 rows containing missing values (`geom_bar()`).
plot(freq2)
```

The default check highlighting can be avoided using the argument `highlight.check = FALSE`.

```
# Frequency distribution for variable y1
freq1 <- freqdist.augmentedRCBD(out1, xlab = "Trait 1",
                                 highlight.check = FALSE)
```

```
Warning: Removed 2 rows containing missing values (`geom_bar()`).
plot(freq1)
```

```
# Frequency distribution for variable y2
freq2 <- freqdist.augmentedRCBD(out2, xlab = "Trait 2",
                                    highlight.check = FALSE)
```

```
Warning: Removed 2 rows containing missing values (`geom_bar()`).
plot(freq2)
```

### 7.5 gva.augmentedRCBD()

The genetic variability statistics such as mean, phenotypic, genotypic and environmental variation (Federer and Searle (1976)), phenotypic, genotypic and environmental coefficient of variation (Burton (1951), Burton (1952)), category of phenotypic and genotypic coefficient of variation according to Sivasubramaniam and Madhavamnen (1973), broad-sense heritability ( $H^2$ ) (Lush (1940)),  $H^2$  category according to Robinson (1966), Genetic advance (GA), genetic advance as per cent of mean (GAM) and GAM category according to Johnson et al. (1955) are computed from an object of class **augmentedRCBD** as follows. Genetic variability analysis needs to be performed only if the sum of squares of "Treatment: Test" are significant.

```
# Genetic variability statistics for variable y1
gva.augmentedRCBD(out1)
```

```
Warning in gva.augmentedRCBD(out1): P-value for "Treatment: Test" is > 0.05.
Genetic variability analysis may not be appropriate for this trait.
```

```
$Mean
[1] 81.0625
```

```
$PV
[1] 72.26786
```

```
$GV
[1] 45.29563
```

```
$EV
```

```
[1] 26.97222

```

Negative estimates of variance components if computed are not abnormal. For information on how to deal with these, refer Robinson et al. (1955) and Dudley and Moll (1969).

## 7.5 report.augmentedRCBD()

The results generated by the analysis can be exported to a MS Word file as follows.

```
# MS word report for variable y1
report.augmentedRCBD(aug = out1,
                      target = file.path(tempdir(),
                                         "augmentedRCBD output.docx"),
                      file.type = "word")

# MS word report for variable y2
report.augmentedRCBD(aug = out2,
                      target = file.path(tempdir(),
                                         "augmentedRCBD output.docx"),
                      file.type = "word")
```

The screenshot shows a Microsoft Word document titled "augmentedRCBD output.docx". The content is organized into several sections:

- augmentedRCBD** (Section title)
- Details** (Table)
 

| Item                       | Details    |

Fig. 6: MS Word report generated with `report.augmentedRCBD` function.

Alternatively, the analysis results can also be exported to a MS Excel file as follows.

```
# MS excel report for variable y1
report.augmentedRCBD(aug = out1,
                      target = file.path(tempdir(),
                                         "augmentedRCBD output.xlsx"),
                      file.type = "excel")

# MS excel report for variable y2
report.augmentedRCBD(aug = out2,
                      target = file.path(tempdir(),
                                         "augmentedRCBD output.xlsx"),
                      file.type = "excel")
```

**Fig. 7:** MS Excel report generated with `report.augmentedRCBD` function.

## 8 Data Analysis for a Multiple Traits

Analysis of data for a multiple traits simultaneously can be performed by using `augmentedRCBD.bulk` function. It generates an object of class `augmentedRCBD.bulk`. Such an object can then be taken as input by `print.augmentedRCBD.bulk` to print the results to console. The results can also be exported as a MS Word report using the `report.augmentedRCBD.bulk` function.

**Fig. 8.** Workflow for analysis of multiple traits with `augmentedRCBD`.

### 8.1 `augmentedRCBD.bulk()`

Consider the data frame `data` imported from Table 1 according to the instructions in section 4.8.

```
str(data)

'data.frame': 20 obs. of 4 variables:
$ blk: Factor w/ 3 levels "1","2","3": 1 1 1 1 1 1 1 2 2 2 ...
$ trt: Factor w/ 12 levels "1","2","3","4",...: 1 2 3 4 7 11 12 1 2 3 ...
$ y1 : num 92 79 87 81 96 89 82 79 81 81 ...
$ y2 : num 258 224 238 278 347 300 289 260 220 237 ...

# Convert block and treatment to factors
data$blk <- as.factor(data$blk)
data$trt <- as.factor(data$trt)
```

Rather than performing the analysis individually for each variable/trait separately using **augmentedRCBD**, the analysis can be performed simultaneously for both the traits using **augmentedRCBD.bulk** function. It is a wrapper around the **augmentedRCBD** core function and its associated helper functions.

However in this case treatment comparisons/grouping by least significant difference or Tukey's honest significant difference method is not computed. Also the output object size is reduced using the **simplify = TRUE** argument in the **augmentedRCBD** function.

The logical arguments **describe**, **freqdist** and **gva** can be used to specify whether to generate the descriptive statistics, frequency distribution plots and genetic variability statistics respectively. If **gva = TRUE**, then plots to compare phenotypic and genotypic coefficient of variation, broad sense heritability and genetic advance over mean between traits are also generated.

```
bout <- augmentedRCBD.bulk(data = data, block = "blk",
                             treatment = "trt", traits = c("y1", "y2"),
                             checks = NULL, alpha = 0.05, describe = TRUE,
                             freqdist = TRUE, gva = TRUE,
                             check.col = c("brown", "darkcyan",
                                           "forestgreen", "purple"),
                             console = TRUE)
```

ANOVA for y1 computed (1/2)

ANOVA for y2 computed (2/2)

### 8.3 report.augmentedRCBD.bulk()

The results generated by the analysis can be exported to a MS Word file as follows.

```
# MS word report
report.augmentedRCBD.bulk(aug.bulk = bout,
                           target = file.path(tempdir(),
                                              "augmentedRCBD bulk output.docx"),
                           file.type = "word")
```

The screenshot shows a Microsoft Word document with the title "augmentedRCBD bulk output.docx". The document contains the following sections:
