

Variable Selection for Health Care Demand in Germany

Zhu Wang
UT Health San Antonio
wangz1@uthscsa.edu

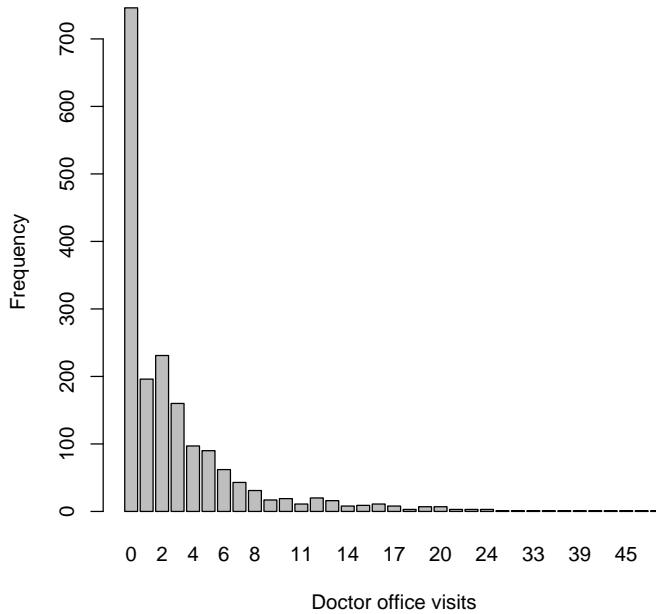

January 28, 2019

This document reproduces the data analysis presented in [Wang et al. \(2015\)](#). In an effort to optimize the computing algorithms, the penalized regression can be slightly different. For a description of the theory behind application illustrated here we refer to the original manuscript.

[Riphahn et al. \(2003\)](#) utilized a part of the German Socioeconomic Panel (GSOEP) data set to analyze the number of doctor visits. The original data have twelve annual waves from 1984 to 1995 for a representative sample of German households, which provide broad information on the health care utilization, current employment status, and the insurance arrangements under which subjects are protected. The data set contains number of doctor office visits for 1,812 West German men aged 25 to 65 years in the last three months of 1994. As shown in the figure, many doctor office visits are zeros, which can be difficult to fit with a Poisson or negative binomial model. Therefore, zero-inflated negative binomial (ZINB) model is considered.

```
R> library("mpath")
R> library("zic")
R> library("pscl")
R> data(docvisits)

R> barplot(with(docvisits, table(docvisits)), ylab = "Frequency",
           xlab = "Doctor office visits")
```

We include the linear spline variables *age30* to *age60* and their interaction terms with the health satisfaction *health*.

```
R> dt <- docvisits[, -(2:3)]
R> tmp <- model.matrix(~age30 * health + age35 * health +
+ age40 * health + age45 * health + age50 * health +
+ age55 * health + age60 * health, data = dt)[, -(1:9)]
R> dat <- cbind(dt, tmp)
```

Full ZINB model with all predictor variables.

```
R> m1 <- zeroinfl(docvisits ~ . | ., data = dat, dist = "negbin")
R> summary(m1)
```

```
Call:
zeroinfl(formula = docvisits ~ . | ., data = dat, dist = "negbin")
```

R> cat("theta estimate", fit.scad$theta[minBic])
theta estimate 1.285

Compute standard errors of coefficients and theta (the last one for theta).

R> se(fit.scad, minBic, log = FALSE)
[1] 0.12478 0.01813 0.10376 0.12196 0.11885 0.08557 0.39939 0.04440
[9] 0.17481 0.24779 0.13360

Compute AIC, BIC, log-likelihood values of the selected model.

R> AIC(fit.scad)[minBic]
0.0228
7320

R> BIC(fit.scad)[minBic]
0.0228
7380

R> logLik(fit.scad)[minBic]
[1] -3649

Compute log-likelihood value via 10-fold cross-validation using 2 CPU cores.

R> fitcv <- cv.zipath(docvisits ~ . | ., data = dat, family = "negbin",
+ gamma.count = 2.5, gamma.zero = 2.5, lambda.count = tmp$lambda.count[1:30],
+ lambda.zero = tmp$lambda.zero[1:30], maxit.em = 300,
+ maxit.theta = 1, theta.fixed = FALSE, penalty = "snet",
+ rescale = FALSE, foldid = foldid, n.cores = 2)
R> cat("cross-validated loglik", max(fitcv$cv))

cross-validated loglik -368.8

Running time for the entire analysis.

R> print(proc.time() - ptm)

  user  system elapsed
743.068   1.691 752.375

```

```
