GRTS Survey Designs for an Area Resource

Thomas Kincaid

May 23, 2011

Contents

This document presents example GRTS survey designs for an area resource. The area resource used in the designs is Omernik level 3 ecoregions within Utah. Four survey designs will be presented: (1) an unstratified, equal probability design; (2) an unstratified, unequal probability design; (3) a stratified, equal probability design; and (4) an unstratified, unequal probability design with an oversample and a panel structure for survey over time. The sampling frame used for the survey designs is contained in either an ESRI shapefile or an sp package object. The frame contains the coordinates for a set of polygons that define the area resource in addition to attribute data associated with the polygons. The coordinate system for the set of points in the sampling frame is an equal area projection rather than latitude and longitude. An equal area projection is used so that calculation of distance between points is valid.

1 Preliminaries

The initial step is to use the library function to load the spsurvey package. After the package is loaded, a message is printed to the R console indicating that the spsurvey package was loaded successfully.

Load the spsurvey package

```
> library(spsurvey)
```

```
Version 2.1 of the spsurvey package was loaded successfully.
```

2 Shapefile attribute data

The next step is to read the attribute data from the shapefile. The read.dbf function in the spsurvey package is used to read the attribute (dbf) file in the shapefile and assign it to a data frame named att. The initial six lines in the att data frame are printed using the head function.

The ecoregion attribute will be used to define stratum codes and unequal selection probability (multidensity) categories for the survey designs. Ecoregion is contained in a variable named "level3_nam" and includes seven unique values. Frame area is summarized for the ecoregion attribute. Note that ecoregion area measured in hectares is contained in the variable named "area_ha". The tapply function is used to calculate total area for each ecoregion. The addmargins function is applied to the output from tapply to calculate total area for all all ecoregions, and the round function is used to round value to whole numbers. Finally, the resulting table is displayed.

Read the attribute table from the shapefile

```
> att <- read.dbf("eco_l3_ut")
```

Display the initial six lines in the attribute data frame

```
> head(att)
```

```
  level3                  level3_nam    area_ha    area_mdm
1     80    Northern Basin and Range  263999.04  2639990439
2     18                Wyoming Basin  291058.83  2910588302

              Wyoming Basin                         Sum
                     291059                    21982984
```

Ecoregions in Utah are displayed in Figure 1. To produce the figure, first the read.shape function in the spsurvey package is used to read the shapefile and assign it to an object named shp. The shp object takes the form of a spatial data object defined in the sp package. Specifically, shp belongs to class "SpatialPolygonsDataFrame". For further information about spatial data objects, see documentation for the sp package. The spplot function in the sp package is used to create the figure.

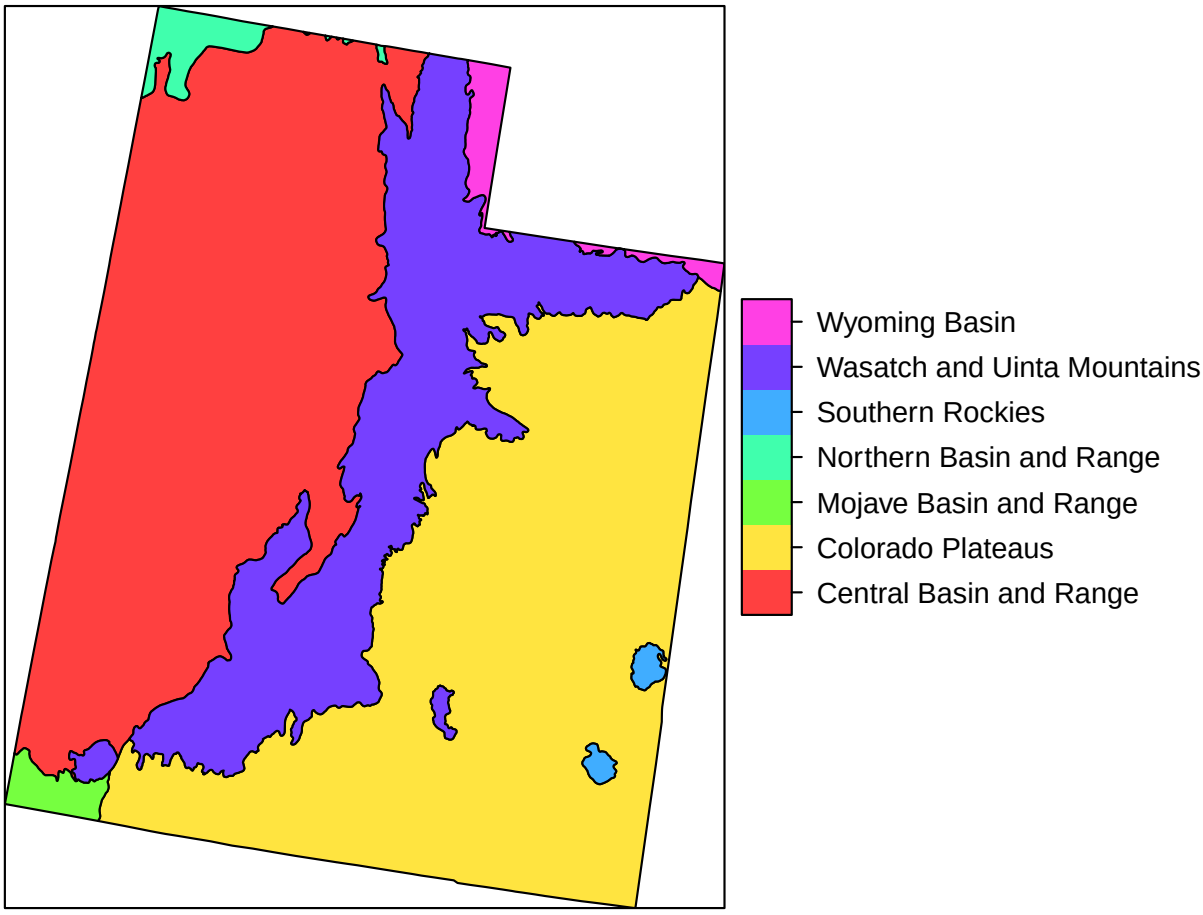

Figure 1: Ecoregions in Utah.

3 Unstratified, equal probability, GRTS survey design

The first survey design is an unstratified, equal probability design. The set.seed function is called so that, if necessary, the designs can be replicated.

The initial step is to create a list named Equaldsgn that contains information for specifying the survey design. Since the survey design is unstratified, the list contains a single item named "None" that also is a list. The "None" list includes two items: panel, which is used to specify the sample size for each panel, and seltype, which is used to input the type of random selection for the design. For this example, panel is assigned a single value named "PanelOne" that is set equal to 115, and seltype is assigned the value "Equal", which indicates equal probability selection.

The grts function in the spsurvey package is called to select the survey design. The following arguments are included in the call to grts: (1) design: the named list of stratum design specifications, which is assigned the Equaldsgn list; (2) DesignID: name for the design, which is used to create a site ID for each site and is assigned the value "EQUAL"; (3) type.frame: the type of frame, which is assigned the value "area" to indicate an area resource; (4) src.frame: source of the frame, which is assigned the value "shapefile" to indicate a shapefile frame; (5) in.shape: name of the input shapefile, which is assigned the value "eco_l3_ut"; (6) att.frame: the data frame of attributes associated with elements in the frame, which is assigned the att data frame; and (7) shapefile: option to create a shapefile containing the survey design information, which is assigned FALSE.

During execution of the grts function, messages are printed that indicate the initial number of hierarchical levels used for the GRTS grid, the current number of levels, and the final number of levels. The set of messages is printed for each stratum, and is labeled with the stratum name. For this example, the set of messages is labeled "None", i.e., the name used in the Equaldsgn list. Upon completion of the call to grts, the initial six sites for the survey design and a design summary are printed.

Call the set.seed function so that the design can be replicated

```
> set.seed(4447864)
```

Create the design list

```
> Equaldsgn <- list(None = list(panel = c(PanelOne = 115), seltype = "Equal"))
```

Select the sample

```
> Equalsites <- grts(design=Equaldsgn,
+                    DesignID="EQUAL",
+                    type.frame="area",
+                    src.frame="shapefile",
+                    in.shape="eco_l3_ut",
+                    att.frame=att,
+                    shapefile=FALSE)

Stratum: None

4 Unstratified, unequal probability, GRTS survey design

The second survey design is an unstratified, unequal probability design. Ecoregions are used to identify multidensity categories. List Unequaldsgn is assigned design specifications. Since the survey design is unstratified, Unequaldsgn includes a single list named "None" that contains three items: panel, seltype, and caty.n. The value for panel is the same as for the equal probability design, and seltype is assigned "Unequal" to indicate unequal selection probabilities. The third item, caty.n, assigns sample sizes for each of seven multidensity categories, where ecoregion names are used as the categories. Note that the sum of sample sizes provided in caty.n must equal the value in panel.

For this survey design, a shapefile will be used as the sampling frame. The following arguments are included in the call to grts: (1) design: assigned the Unequaldsgn list; (2) DesignID: assigned the value "UNEQUAL"; (3) type.frame: assigned the value "area"; (4) src.frame: assigned the value "shapefile"; (5) in.shape: assigned the value "eco_l3_ut"; (6) att.frame: assigned the att data frame; (7) mdcaty: name of the column in the attributes data frame that identifies the unequal probability category for each element in the frame, which is assigned the value "level3_nam"; and (8) shapefile: assigned the value FALSE. Upon completion of the call to grts, the initial six sites for the survey design and a design summary are printed.

Create the design list

```
> Unequaldsgn <- list(None=list(panel=c(PanelOne=115),
+                               seltype="Unequal",
```

```
+                                caty.n=c("Central Basin and Range"=25,
+                                         "Colorado Plateaus"=25,
+                                         "Mojave Basin and Range"=10,
+                                         "Northern Basin and Range"=10,
+                                         "Southern Rockies"=10,
+                                         "Wasatch and Uinta Mountains"=25,
 +                                       "Wyoming Basin"=10)))
```

Select the sample

```
> Unequalsites <- grts(design=Unequaldsgn,
+                      DesignID="UNEQUAL",
+                      type.frame="area",
+                      src.frame="shapefile",
+                      in.shape="eco_l3_ut",
+                      att.frame=att,
+                      mdcaty="level3_nam",

```

5 Stratified, equal probability, GRTS survey design

The third survey design is a stratified, equal probability design. Ecoregions are used to identify strata. List Stratdsgn is assigned design specifications. The ecoregion attribute is used to identify strata. Stratdsgn includes seven lists, one for each stratum. The names for the lists match the levels of the stratum variable, i.e., the unique values of the ecoregion attribute. Each list in Stratdsgn contains two items: panel and seltype. The value for panel is the same as for the equal probability design, and seltype is assigned "Equal".

For this survey design, an sp package object will be used as the sampling frame. Recall that the read.shape function was used to read the shapefile and assign its output to an sp object named shp. The following arguments are included in the call to grts: (1) design: assigned the Stratdsgn list; (2) DesignID: assigned the value "STRATIFIED"; (3) type.frame: assigned the value "area"; (4) src.frame: assigned the value "sp.object" to indicate that the sampling frame is provided by an sp object; (5) sp.object: name of the sp object, which is assigned the shp object; (6) att.frame: assigned the att data frame; 7) stratum: name of the column in the attributes data frame that identifies the stratum code for each element in the frame, which is assigned the value "level3_nam"; and (8) shapefile: assigned the value FALSE. Upon completion of the call to grts, the initial six sites for the survey design and a design summary are printed.

Create the design list

```
> Stratdsgn <- list("Central Basin and Range"=list(panel=c(PanelOne=25),
+                                                  seltype="Equal"),
+                   "Colorado Plateaus"=list(panel=c(PanelOne=25),
+                                            seltype="Equal"),
+                   "Mojave Basin and Range"=list(panel=c(PanelOne=10),
+                                                 seltype="Equal"),
+                   "Northern Basin and Range"=list(panel=c(PanelOne=10),
+                                                   seltype="Equal"),
+                   "Southern Rockies"=list(panel=c(PanelOne=10),
+                                           seltype="Equal"),
+                   "Wasatch and Uinta Mountains"=list(panel=c(PanelOne=25),
+                                                      seltype="Equal"),
+                   "Wyoming Basin"=list(panel=c(PanelOne=10),
+                                        seltype="Equal"))
```

Select the sample

```
> Stratsites <- grts(design=Stratdsgn,
+                    DesignID="STRATIFIED",
+                    type.frame="area",
+                    src.frame="sp.object",
+                    sp.object=shp,

6 Unstratified, unequal probability, GRTS survey design with an oversample and a panel structure for survey over time

The fourth survey design is an unstratified, unequal probability design with an oversample and a panel structure for survey over time. List Paneldsgn is assigned design specifications. Since the survey design is unstratified, Paneldsgn includes a single list named "None" that contains four items: panel, seltype, caty.n, and over. A vector identifying sample sizes for five panels is assigned to panel. The value "Unequal" is assigned seltype, which indicates unequal selection probabilities. The third item, caty.n, assigns sample sizes for each of seven multidensity categories, where ecoregion names

are used as the categories. Note that the sum of sample sizes provided in caty.n must equal the sum of sample sizes in panel. The value 100 is assigned to over, which specifies an oversample of 100 sites. An oversample is replacement sites for the survey design. The grts function attempts to distribute the oversample proportionately among sample sizes for the multidensity categories. If the oversample proportion for one or more categories is not a whole number, a warning message is printed and the proportion is rounded to the next higher integer. For this example, the oversample is not proportionate to the category sample sizes, and the warning message is printed by calling the warnings function.

For this survey design, a shapefile will be used as the sampling frame. The following arguments are included in the call to grts: (1) design: assigned the Paneldsgn list; (2) DesignID: assigned the value "UNEQUAL"; (3) type.frame: assigned the value "area"; (4) src.frame: assigned the value "shapefile"; (5) in.shape: assigned the value "eco_l3_ut"; (6) att.frame: assigned the att data frame; (7) mdcaty: assigned the value "level3_nam"; and (8) shapefile: assigned the value FALSE. Upon completion of the call to grts, the initial six sites for the survey design and a design summary are printed.

Create the design list

```
> Paneldsgn <- list(None=list(panel=c(Panel_1=50, Panel_2=50, Panel_3=50,
+                                     Panel_4=50, Panel_5=50),
+                             seltype="Unequal",
