

Package ‘stokes’

April 27, 2021

Type Package

Title The Exterior Calculus

Version 1.0-7

Depends spray (>= 1.0-11)

Suggests knitr,

Deriv,

testthat,

markdown,

rmarkdown

VignetteBuilder knitr

Imports permutations (>= 1.0-4), partitions, magrittr, methods, mathjaxr

Maintainer Robin K. S. Hankin <hankin.robin@gmail.com>

Description Provides functionality for working with tensors, alternating tensors, wedge products, Stokes's theorem, and related concepts from the exterior calculus. Functionality for Grassman algebra is provided. The canonical reference would be:
M. Spivak (1965, ISBN:0-8053-9021-9) ``Calculus on Manifolds".

[spray](#)

Examples

```
## Some k-tensors:
U1 <- as.ktensor(matrix(1:15,5,3))
U2 <- as.ktensor(cbind(1:3,2:4),1:3)

## Coerce a tensor to functional form, here mapping V^3 -> R (here V=R^15):
as.function(U1)(matrix(rnorm(45),15,3))

## Tensor cross-product is cross() or %X%:
U1 %X% U2

## A k-form is an alternating k-tensor:
K1 <- as.kform(cbind(1:5,2:6),rnorm(5))
K2 <- kform_general(3:6,2,1:6)
```

```

K3 <- rform(9,3,9,runif(9))

## The distributive law is true

(K1 + K2) %^% K3 == K1 %^% K3 + K2 %^% K3 # TRUE to numerical precision

## Wedge product is associative (non-trivial):
(K1 %^% K2) %^% K3
K1 %^% (K2 %^% K3)

## k-forms can be coerced to a function and wedge product:
f <- as.function(K1 %^% K2 %^% K3)

## E is a random point in V^k:
E <- matrix(rnorm(63),9,7)

## f() is alternating:
f(E)
f(E[,7:1])

## The package blurs the distinction between symbolic and numeric computing:
dx <- as.kform(1)
dy <- as.kform(2)
dz <- as.kform(3)

dx %^% dy %^% dz

K3 %^% dx %^% dy %^% dz

```

Alt*Alternating multilinear forms***Description**

Converts a k -tensor to alternating form

Usage

```
Alt(S,give_kform)
```

Arguments

| | |
|-------------------|---|
| S | A multilinear form, an object of class <code>ktensor</code> |
| give_kform | Boolean, with default FALSE meaning to return an alternating k -tensor [that is, an object of class <code>ktensor</code> that happens to be alternating] and TRUE meaning to return a k -form [that is, an object of class <code>kform</code>] |

Details

Given a k -tensor T , we have

$$\text{Alt}(T)(v_1, \dots, v_k) = \frac{1}{k!} \sum_{\sigma \in S_k} \text{sgn}(\sigma) \cdot T(v_{\sigma(1)}, \dots, v_{\sigma(k)})$$

Thus for example if $k = 3$:

$$\text{Alt}(T)(v_1, v_2, v_3) = \frac{1}{6} \begin{pmatrix} +T(v_1, v_2, v_3) & -T(v_1, v_3, v_2) \\ -T(v_2, v_1, v_3) & +T(v_2, v_3, v_1) \\ +T(v_3, v_1, v_2) & -T(v_3, v_2, v_1) \end{pmatrix}$$

and it is reasonably easy to see that $\text{Alt}(T)$ is alternating, in the sense that

$$\text{Alt}(T)(v_1, \dots, v_i, \dots, v_j, \dots, v_k) = -\text{Alt}(T)(v_1, \dots, v_j, \dots, v_i, \dots, v_k)$$

Function `Alt()` is intended to take and return an object of class `ktensor`; but if given a `kform` object, it just returns its argument unchanged.

Value

Returns an alternating k -tensor. To work with k -forms, which are a much more efficient representation of alternating tensors, use `as.kform()`.

[kform](#)

Examples

```
S <- as.ktensor(expand.grid(1:3,1:3),rnorm(9))
S
Alt(S)

issmall(Alt(S) - Alt(Alt(S))) # should be TRUE

a <- rtensor()
a
V <- matrix(rnorm(21),ncol=3)
c(as.function(Alt(a))(V), as.function(Alt(a,give_kform=TRUE))(V)) # should match
```

as.1form*Coerce vectors to 1-forms***Description**

Given a vector, return the corresponding 1-form; the exterior derivative of a 0-form (that is, a scalar function). Function `grad()` is a synonym.

Usage

```
as.1form(v)
grad(v)
```

Arguments

| | |
|---|---|
| v | A vector with element i being $\partial f / \partial x_i$ |
|---|---|

Details

The exterior derivative of a k -form ϕ is a $(k + 1)$ -form $\mathbf{d}\phi$ given by

$$\mathbf{d}\phi(P_{\mathbf{x}}(\mathbf{v}_i, \dots, \mathbf{v}_{k+1})) = \lim_{h \rightarrow 0} \frac{1}{h^{k+1}} \int_{\partial P_{\mathbf{x}}(h\mathbf{v}_1, \dots, h\mathbf{v}_{k+1})} \phi$$

We can use the facts that

$$\mathbf{d}(f dx_{i_1} \wedge \dots \wedge dx_{i_k}) = \mathbf{d}f \wedge dx_{i_1} \wedge \dots \wedge dx_{i_k}$$

and

$$\mathbf{d}f = \sum_{j=1}^n (D_j f) dx_j$$

to calculate differentials of general k -forms. Specifically, if

$$\phi = \sum_{1 \leq i_1 < \dots < i_k \leq n} a_{i_1 \dots i_k} dx_{i_1} \wedge \dots \wedge dx_{i_k}$$

then

$$\mathbf{d}\phi = \sum_{1 \leq i_1 < \dots < i_k \leq n} \left[\sum_{j=1}^n D_j a_{i_1 \dots i_k} dx_j \right] \wedge dx_{i_1} \wedge \dots \wedge dx_{i_k}.$$

The entry in square brackets is given by `grad()`. See the examples for appropriate R idiom.

Value

A one-form

Author(s)

Robin K. S. Hankin

See Also[kform](#)**Examples**

```
as.1form(1:9) # note ordering of terms  
  
as.1form(rnorm(20))  
  
grad(c(4,7)) %^% grad(1:4)
```

consolidate*Various low-level helper functions*

Description

Various low-level helper functions used in `Alt()` and `kform()`

Usage

```
consolidate(S)
kill_trivial_rows(S)
include_perms(S)
kform_to_ktensor(S)
```

Arguments

S Object of class `spray`

Details

Low-level helper functions.

- Function `consolidate()` takes a `spray` object, and combines any rows that are identical up to a permutation, respecting the sign of the permutation
- Function `kill_trivial_rows()` takes a `spray` object and deletes any rows with a repeated entry (which have k -forms identically zero)
- Function `include_perms()` replaces each row of a `spray` object with all its permutations, respecting the sign of the permutation
- Function `ktensor_to_kform()` will coerce a k -form to a k -tensor

Value

The functions documented here all return a `spray` object.

Author(s)

Robin K. S. Hankin

Examples

```
S <- spray(matrix(c(1,1,2,2,1,3,3,1,3,5),ncol=2,byrow=TRUE),1:5)
kill_trivial_rows(S)
consolidate(S)

## Function include_perms() expects no trivial rows:

## Not run: include_perms(S) # fails (row 1 and row 3 are repeated)

include_perms(kill_trivial_rows(S)) # This should work

a <- rform()
V <- matrix(rnorm(21),ncol=3)
as.function(a)(V) - as.function(as.kform(a))(V) # should be zero
```

contract

Contractions of k-forms

Description

A contraction is a natural linear map from k -forms to $k - 1$ -forms.

Usage

```
contract(K,v,lose=TRUE)
contract_elementary(o,v)
```

Arguments

| | |
|------|---|
| K | A k -form |
| o | Integer-valued vector corresponding to one row of an index matrix |
| lose | Boolean, with default TRUE meaning to coerce a 0-form to a scalar and FALSE meaning to return the formal 0-form |
| v | A vector; in function contract(), if a matrix, interpret each column as a vector to contract with |

Details

Given a k -form ϕ and a vector \mathbf{v} , the *contraction* $\phi_{\mathbf{v}}$ of ϕ and \mathbf{v} is a $k - 1$ -form with

$$\phi_{\mathbf{v}}(\mathbf{v}^1, \dots, \mathbf{v}^{k-1}) = \phi(\mathbf{v}, \mathbf{v}^1, \dots, \mathbf{v}^{k-1})$$

if $k > 1$; we specify $\phi_{\mathbf{v}} = \phi(\mathbf{v})$ if $k = 1$.

Function `contract_elementary()` is a low-level helper function that translates elementary k -forms with coefficient 1 (in the form of an integer vector corresponding to one row of an index matrix) into its contraction with \mathbf{v} .

Value

Returns an object of class `kform`.

Author(s)

Robin K. S. Hankin

```
contract(as.kform(1:5),1:8)
contract(as.kform(1),3)    # 0-form

## Now some verification:
o <- kform(spray(t(replicate(2, sample(9,5))), runif(2)))
V <- matrix(rnorm(45),ncol=5)
jj <- c(
  as.function(o)(V),
  as.function(contract(o,V[,1],drop=TRUE))(V[,-1]), # scalar
  as.function(contract(o,V[,1:2]))(V[,-(1:2),drop=FALSE]),
  as.function(contract(o,V[,1:3]))(V[,-(1:3),drop=FALSE]),
  as.function(contract(o,V[,1:4]))(V[,-(1:4),drop=FALSE]),
  as.function(contract(o,V[,1:5],lose=FALSE))(V[,-(1:5),drop=FALSE])
)
max(jj) - min(jj) # zero to numerical precision
```

`cross`*Cross products of k-tensors*

Description

Cross products of k -tensors

Usage

```
cross(U, ...)  
cross2(U1, U2)
```

Arguments

| | |
|------------------------|--------------------------------------|
| <code>U, U1, U2</code> | Object of class <code>ktensor</code> |
| <code>...</code> | Further arguments, currently ignored |

Details

Given a k -tensor S and an l -tensor T , we can form the cross product $S \otimes T$, defined as

$$S \otimes T (v_1, \dots, v_k, v_{k+1}, \dots, v_{k+l}) = S (v_1, \dots, v_k) \cdot T (v_{k+1}, \dots, v_{k+l}).$$

Package idiom for this includes `cross(S, T)` and `S %X% T`; note that the cross product is not commutative. Function `cross()` can take any number of arguments (the result is well-defined because the cross product is associative); it uses `cross2()` as a low-level helper function.

Value

The functions documented here all return a `spray` object.

Note

The binary form `%X%` uses uppercase X to avoid clashing with `%x%` which is the Kronecker product in base R.

Examples

```
M <- cbind(1:4,2:5)
U1 <- as.ktensor(M,rnorm(4))
U2 <- as.ktensor(t(M),1:2)

cross(U1, U2)
cross(U2, U1) # not the same!

U1 %X% U2 - U2 %X% U1
```

hodge

*Hodge star operator***Description**

Given a k -form, return its Hodge dual

Usage

```
hodge(K, n=max(index(K)), g=rep(1,n), lose=TRUE)
```

Arguments

| | |
|------|---|
| K | Object of class kform |
| n | Dimensionality of space, defaulting to the largest element of the index |
| g | Diagonal of the metric tensor, defaulting to the standard metric |
| lose | Boolean, with default TRUE meaning to coerce to a scalar if appropriate |

Value

Given a k -form, in an n -dimensional space, returns a $(n - k)$ -form.

Author(s)

Robin K. S. Hankin

See Also

[wedge](#)

Examples

```
hodge(rform())
hodge(kform_general(4,2),g=c(-1,1,1,1))

## Some edge-cases:
hodge(zero(5),9)
hodge(volume(5))
hodge(volume(5),lose=TRUE)
hodge(scalar(7),n=9)
```

| | |
|-------|-------------------------------|
| inner | <i>Inner product operator</i> |
|-------|-------------------------------|

Description

The inner product

Usage

```
inner(M)
```

Arguments

| | |
|---|---------------|
| M | square matrix |
|---|---------------|

Details

The inner product of two vectors \mathbf{x} and \mathbf{y} is usually written $\langle \mathbf{x}, \mathbf{y} \rangle$ or $\mathbf{x} \cdot \mathbf{y}$, but the most general form would be $\mathbf{x}^T M \mathbf{y}$ where M is a positive-definite matrix. Noting that inner products are symmetric, that is $\langle \mathbf{x}, \mathbf{y} \rangle = \langle \mathbf{y}, \mathbf{x} \rangle$ (we are considering the real case only), and multilinear, that is $\langle \mathbf{x}, a\mathbf{y} + b\mathbf{z} \rangle = a\langle \mathbf{x}, \mathbf{y} \rangle + b\langle \mathbf{x}, \mathbf{z} \rangle$, we see that the inner product is indeed a multilinear map, that is, a tensor.

Given a square matrix m with entries M_{ij} , function `inner(m)` returns the 2-form that maps \mathbf{x}, \mathbf{y} to $\mathbf{x}^T M \mathbf{y}$.

Value

Returns a k -tensor, an inner product

Author(s)

Robin K. S. Hankin

See Also

[kform](#)

Examples

```
inner(diag(7))
inner(matrix(1:9, 3, 3))

## Compare the following two:
Alt(inner(matrix(1:9, 3, 3)))      # An alternating k tensor
as.kform(inner(matrix(1:9, 3, 3))) # Same thing coerced to a kform

f <- as.function(inner(diag(7)))
X <- matrix(rnorm(14), ncol=2) # random element of (R^7)^2
f(X) - sum(X[,1]*X[,2]) # zero to numerical precision

## verify positive-definiteness:
g <- as.function(inner(crossprod(matrix(rnorm(56), 8, 7))))
stopifnot(g(kronecker(rnorm(7), t(c(1,1))))>0)
```

issmall

*Is a form zero to within numerical precision?***Description**

Given a k -form, return TRUE if it is “small”

Usage

```
issmall(M, tol=1e-8)
```

Arguments

| | |
|-----|-------------------------------------|
| M | Object of class kform or ktensor |
| tol | Small tolerance, defaulting to 1e-8 |

Value

Returns a logical

Author(s)

Robin K. S. Hankin

Examples

```

o <- kform_general(4,2,runif(6))
M <- matrix(rnorm(36),6,6)

discrepancy <- o - transform(transform(o,M),solve(M))

issmall(discrepancy) # should be TRUE
is.zero(discrepancy) # might be FALSE

```

keep

*Keep or drop variables***Description**

Keep or drop variables

Usage

```
keep(K, yes)
discard(K, no)
```

Arguments

| | |
|--------|--|
| K | Object of class kform |
| yes,no | Specification of dimensions to either keep (yes) or discard (no), coerced to a free object |

Details

Function `keep(omega, yes)` keeps the terms specified and `discard(omega, no)` discards the terms specified. It is not clear to me what these functions mean from a mathematical perspective.

Value

The functions documented here all return a `kform` object.

Author(s)

Robin K. S. Hankin

See Also

[lose](#)

Examples

```
keep(kform_general(7,3),1:4)  # keeps only terms with dimensions 1-4
discard(kform_general(7,3),1) # loses any term with a "1" in the index
```

`kform`

k-forms

Description

Functionality for dealing with *k*-forms

Usage

```
kform(S)
as.kform(M,coeffs,lose=TRUE)
kform_basis(n, k)
kform_general(W,k,coeffs,lose=TRUE)
is.kform(x)
## S3 method for class 'kform'
as.function(x,...)
```

Arguments

| | |
|-----------------------|---|
| <code>n</code> | Dimension of the vector space $V = R^n$ |
| <code>k</code> | A <i>k</i> -form maps V^k to R |
| <code>W</code> | Integer vector of dimensions |
| <code>M,coeffs</code> | Index matrix and coefficients for a <i>k</i> -form |
| <code>S</code> | Object of class <code>spray</code> |
| <code>lose</code> | Boolean, with default TRUE meaning to coerce a 0-form to a scalar and FALSE meaning to return the formal 0-form |
| <code>x</code> | Object of class <code>kform</code> |
| <code>...</code> | Further arguments, currently ignored |

Details

A k -form is an alternating k -tensor.

Recall that a k -tensor is a multilinear map from V^k to the reals, where $V = R^n$ is a vector space. A multilinear k -tensor T is *alternating* if it satisfies

$$T(v_1, \dots, v_i, \dots, v_j, \dots, v_k) = T(v_1, \dots, v_j, \dots, v_i, \dots, v_k)$$

Function `kform_basis()` is a low-level helper function that returns a matrix whose rows constitute a basis for the vector space $\Lambda^k(R^n)$ of k -tensors:

$$\phi = \sum_{1 \leq i_1 < \dots < i_k \leq n} a_{i_1 \dots i_k} dx_{i_1} \wedge \dots \wedge dx_{i_k}$$

and indeed we have:

$$a_{i_1 \dots i_k} = \phi(\mathbf{e}_{i_1}, \dots, \mathbf{e}_{i_k})$$

where \mathbf{e}_j , $1 \leq j \leq k$ is a basis for V .

In the `stokes` package, k -forms are represented as sparse arrays (spray objects), but with a class of `c("kform", "spray")`. The constructor function (`kform()`) ensures that rows of the index matrix are strictly nonnegative integers, have no repeated entries, and are strictly increasing.

Value

All functions documented here return a `kform` object except as `.function.kform()`, which returns a function.

Note

Hubbard and Hubbard use the term “ k -form”, but Spivak does not.

Author(s)

Robin K. S. Hankin

References

`ktensor,lose`

Examples

```
as.kform(cbind(1:5,2:6),rnorm(5))
kform_general(1:4,2,coeffs=1:6) # used in electromagnetism

K1 <- as.kform(cbind(1:5,2:6),rnorm(5))
K2 <- kform_general(5:8,2,1:6)
wedge(K1,K2)
```

```
f <- as.function(wedge(K1,K2))
E <- matrix(rnorm(32),8,4)

f(E) + f(E[,c(1,3,2,4)]) # should be zero
```

ktensor*k-tensors***Description**

Functionality for *k*-tensors

Usage

```
ktensor(S)
as.ktensor(M,coeffs)
is.ktensor(x)
## S3 method for class 'ktensor'
as.function(x,...)
```

Arguments

| | |
|----------|---|
| M,coeffs | Matrix of indices and coefficients, as in spray(M,coeffs) |
| S | Object of class spray |
| x | Object of class ktensor |
| ... | Further arguments, currently ignored |

Details

A *k*-tensor object S is a map from V^k to the reals R , where V is a vector space (here R^n) that satisfies multilinearity:

$$S(v_1, \dots, av_i, \dots, v_k) = a \cdot S(v_1, \dots, v_i, \dots, v_k)$$

and

$$S(v_1, \dots, v_i + v'_i, \dots, v_k) = S(v_1, \dots, v_i, \dots, v_k) + S(v_1, \dots, v'_i, \dots, v_k).$$

Note that this is *not* equivalent to linearity over V^{nk} (see examples).

In the **stokes** package, *k*-tensors are represented as sparse arrays (spray objects), but with a class of c("ktensor", "spray"). This is a natural and efficient representation for tensors that takes advantage of sparsity using **spray** package features.

Function `as.ktensor()` will coerce a *k*-form to a *k*-tensor via `kform_to_ktensor()`.

Value

All functions documented here return a `ktensor` object except `as.function.ktensor()`, which returns a function.

Author(s)

Robin K. S. Hankin

References

Spivak 1961

See Also

[cross](#), [kform](#), [wedge](#)

Examples

```

ktensor(rspray(4,powers=1:4))
as.ktensor(cbind(1:4,2:5,3:6),1:4)

## Test multilinearity:
k <- 4
n <- 5
u <- 3

## Define a randomish k-tensor:
S <- ktensor(spray(matrix(1+sample(u*k)%%n,u,k),seq_len(u)))

## And a random point in V^k:
E <- matrix(rnorm(n*k),n,k)

E1 <- E2 <- E3 <- E

x1 <- rnorm(n)
x2 <- rnorm(n)
r1 <- rnorm(1)
r2 <- rnorm(1)

# change one column:
E1[,2] <- x1
E2[,2] <- x2
E3[,2] <- r1*x1 + r2*x2

f <- as.function(S)

r1*f(E1) + r2*f(E2) - f(E3) # should be small

## Note that multilinearity is different from linearity:
r1*f(E1) + r2*f(E2) - f(r1*E1 + r2*E2) # not small!

```

Description

Allows arithmetic operators to be used for k -forms and k -tensors such as addition, multiplication, etc, where defined.

Usage

```
## S3 method for class 'kform'
Ops(e1, e2 = NULL)
## S3 method for class 'ktensor'
Ops(e1, e2 = NULL)
```

Arguments

| | |
|--------|---|
| e1, e2 | Objects of class <code>kform</code> or <code>ktensor</code> |
|--------|---|

Details

The functions `Ops.kform()` and `Ops.ktensor()` pass unary and binary arithmetic operators (“+”, “-”, “*”, and “/”) to the appropriate specialist function by coercing to spray objects.

For wedge products of k -forms, use `wedge()` or `%^%`; and for cross products of k -tensors, use `cross()` or `%X%`.

Value

All functions documented here return an object of class `kform` or `ktensor`.

Note

A plain asterisk, “*”, given two `kforms` or two `ktensors`, will return the wedge product or the cross product respectively, on the grounds that the idiom has only one natural interpretation. But its use is discouraged.

Author(s)

Robin K. S. Hankin

Examples

```
## dx_1 ^ dx_2 + 6dx_5 ^ dx_6:
as.kform(1) %^% as.kform(2) + 6*as.kform(5) %^% as.kform(6)

k1 <- kform_general(4,2,rnorm(6))
k2 <- kform_general(4,2,rnorm(6))

E <- matrix(rnorm(8),4,2)
as.function(k1+k2)(E)

as.function(2*k1+3*k2)(E)-(2*as.function(k1)(E) + 3*as.function(k1)(E))
## should be small
```

| | |
|---------------------------|--|
| <code>print.stokes</code> | <i>Print methods for k-tensors and k-forms</i> |
|---------------------------|--|

Description

Print methods for objects with options for printing in matrix form or multivariate polynomial form

Usage

```
## S3 method for class 'kform'
print(x, ...)
## S3 method for class 'ktensor'
print(x, ...)
```

Arguments

| | |
|------------------|---------------------------------------|
| <code>x</code> | <i>k-form or k-tensor</i> |
| <code>...</code> | Further arguments (currently ignored) |

Details

The print method is designed to tell the user that an object is a tensor or a *k*-form. It prints a message to this effect (with special dispensation for zero tensors), then calls the `spray` print method.

Value

Returns its argument invisibly.

Note

The print method asserts that its argument is a map from R^n to R , where n is the largest element in the index matrix. However, such a map naturally furnishes a map from R^m to R provided that $m \geq n$ via the natural projection from R^n to R^m . Formally this would be $(x_1, \dots, x_n) \mapsto (x_1, \dots, x_n, 0, \dots, 0) \in R^m$. In the case of the zero *k*-form or *k*-tensor, “ n ” is to be interpreted as “any $n \geq 0$ ”.

Author(s)

Robin K. S. Hankin

Examples

```
rform()
rtensor()

## spray print options work:
options(polyform = TRUE)
rtensor()

## reset to default
options(polyform = FALSE)
```

rform*Random kforms and ktensors***Description**

Random k -form objects and k -tensors, intended as quick “get you going” examples

Usage

```
rform(terms=9,k=3,n=7,coeffs)
rtensor(terms=9,k=3,n=7,coeffs)
```

Arguments

| | |
|---------------------|--|
| <code>terms</code> | Number of distinct terms |
| <code>k,n</code> | A k -form maps V^k to R , where $V = R^n$ |
| <code>coeffs</code> | The coefficients of the form; if missing use <code>seq_len(terms)</code> |

Details

What you see is what you get, basically.

Note that argument `terms` is an upper bound, as the index matrix might contain repeats which are combined.

Value

All functions documented here return an object of class `kform` or `ktensor`.

Author(s)

Robin K. S. Hankin

Examples

```
rform()
rform() %^% rform()

rtensor() %% rtensor()

dx <- as.kform(1)
dy <- as.kform(2)
rform() %^% dx
rform() %^% dx %^% dy
```

| | |
|--------|------------------------|
| scalar | <i>Lose attributes</i> |
|--------|------------------------|

Description

Scalars: 0-forms and 0-tensors

Usage

```
scalar(s,lose=FALSE)
is.scalar(M)
`^0form`(s,lose=FALSE)
## S3 method for class 'kform'
lose(M)
## S3 method for class 'ktensor'
lose(M)
```

Arguments

| | |
|------|--|
| s | A scalar value; a number |
| M | Object of class ktensor or kform |
| lose | In function <code>scalar()</code> , Boolean with TRUE meaning to return a normal scalar, and default FALSE meaning to return a formal 0-form or 0-tensor |

Details

A k -tensor (including k -forms) maps k vectors to a scalar. If $k = 0$, then a 0-tensor maps no vectors to a scalar, that is, mapping nothing at all to a scalar, or what normal people would call a plain old scalar. Such forms are created by a couple of constructions in the package, specifically `scalar()`, `kform_general(1,0)` and `contract()`. These functions take a `lose` argument that behaves much like the `drop` argument in base extraction.

Function `lose()` takes an object of class `ktensor` or `kform` and, if of arity zero, returns the coefficient.

Note that function `kform()` *always* returns a `kform` object, it never loses attributes.

A 0-form is not the same thing as a zero tensor. A 0-form maps V^0 to the reals; a scalar. A zero tensor maps V^k to zero.

Value

The functions documented here return an object of class `kform` or `ktensor`, except for `is.scalar()`, which returns a Boolean.

Author(s)

Robin K. S. Hankin

See Also

[zeroform](#), [lose](#)

Examples

```

o <- scalar(5)
o
lose(o)

kform_general(1,0)
kform_general(1,0,lose=FALSE)

```

symbolic

*Symbolic form***Description**

Prints k -tensor and k -form objects in symbolic form

Usage

```
as.symbolic(M, symbols=letters, d="")
```

Arguments

| | |
|---------|--|
| M | Object of class <code>kform</code> or <code>ktensor</code> ; a map from V^k to R , where $V = R^n$ |
| symbols | A character vector giving the names of the symbols |
| d | String specifying the appearance of the differential operator |

Value

Returns a noquote character string.

Author(s)

Robin K. S. Hankin

Examples

```

as.symbolic(rtensor())
as.symbolic(rform())

as.symbolic(kform_general(3,2,1:3),d="d",symbols=letters[23:26])

```

transform

*Linear transforms of k-forms***Description**

Given a k -form, express it in terms of linear combinations of the dx_i

Usage

```
transform(K,M)
stretch(K,d)
```

Arguments

| | |
|---|--|
| K | Object of class kform |
| M | Matrix of transformation |
| d | Numeric vector representing the diagonal elements of a diagonal matrix |

Details

Suppose we are given a two-form

$$\omega = \sum_{i < j} a_{ij} dx_i \wedge dx_j$$

and relationships

$$dx_i = \sum_r M_{ir} dy_r$$

then we would have

$$\omega = \sum_{i < j} a_{ij} \left(\sum_r M_{ir} dy_r \right) \wedge \left(\sum_r M_{jr} dy_r \right).$$

The general situation would be a k -form where we would have

$$\omega = \sum_{i_1 < \dots < i_k} a_{i_1 \dots i_k} dx_{i_1} \wedge \dots \wedge dx_{i_k}$$

giving

$$\omega = \sum_{i_1 < \dots < i_k} \left[a_{i_1, \dots, i_k} \left(\sum_r M_{i_1 r} dy_r \right) \wedge \dots \wedge \left(\sum_r M_{i_k r} dy_r \right) \right].$$

The `transform()` function does all this but it is slow. I am not 100% sure that there isn't a much more efficient way to do such a transformation. There are a few tests in `tests/testthat` and a discussion in the `stokes` vignette.

Function `stretch()` carries out the same operation but for M a diagonal matrix. It is much faster than `transform()`.

Value

The functions documented here return an object of class `kform`.

Author(s)

Robin K. S. Hankin

[wedge](#)

Examples

```
# Example in the text:
K <- as.kform(matrix(c(1,1,2,3),2,2),c(1,5))
M <- matrix(1:9,3,3)
transform(K,M)

# Demonstrate that the result can be complicated:
M <- matrix(rnorm(25),5,5)
transform(as.kform(1:2),M)

# Numerical verification:
o <- rform(terms=2,n=5)

o2 <- transform(transform(o,M),solve(M))
max(abs(value(o-o2))) # zero to numerical precision

# Following should be zero:
transform(as.kform(1),M)-as.kform(matrix(1:5),c(crossprod(M,c(1,rep(0,4)))))

# Following should be TRUE:
issmall(transform(o,crossprod(matrix(rnorm(10),2,5)))) 

# Some stretch() use-cases:

p <- rform()
p
stretch(p,seq_len(7))
stretch(p,c(1,0,1,1,1)) # kills dimension 2
```

Description

The volume element in n dimensions

Usage

```
volume(n)
is.volume(K)
```

Arguments

| | |
|---|------------------------|
| n | Dimension of the space |
| K | Object of class kform |

Details

Spivak phrases it well (theorem 4.6, page 82):

If V has dimension n , it follows that $\Lambda^n(V)$ has dimension 1. Thus all alternating n -tensors on V are multiples of any non-zero one. Since the determinant is an example of such a member of $\Lambda^n(V)$ it is not surprising to find it in the following theorem:

Let v_1, \dots, v_n be a basis for V and let $\omega \in \Lambda^n(V)$. If $w_i = \sum_{j=1}^n a_{ij} v_j$ then

$$\omega(w_1, \dots, w_n) = \det(a_{ij}) \cdot \omega(v_1, \dots, v_n)$$

(see the examples for numerical verification of this).

Neither the zero k -form, nor scalars, are considered to be a volume element.

Value

Function `volume()` returns an object of class `kform`; function `is.volume()` returns a Boolean.

[zeroform](#), [as.1form](#)

Examples

```
as.kform(1) %^% as.kform(2) %^% as.kform(3) == volume(3) # should be TRUE

o <- volume(5)
M <- matrix(runif(25), 5, 5)
det(M) - as.function(o)(M) # should be zero
```

wedge*Wedge products*

Description

Wedge products of k -forms

Usage

```
wedge2(K1,K2)
wedge(x, ...)
```

Arguments

K1, K2, x, ... k -forms

Details

Wedge product of k -forms.

Value

The functions documented here return an object of class `kform`.

Note

In general use, use `wedge()` or `%^%`. Function `wedge()` uses low-level helper function `wedge2()`, which takes only two arguments.

Author(s)

Robin K. S. Hankin

Examples

```
k1 <- as.kform(cbind(1:5,2:6),1:5)
k2 <- as.kform(cbind(5:7,6:8,7:9),1:3)
k3 <- kform_general(1:6,2)

a1 <- wedge2(k1,wedge2(k2,k3))
a2 <- wedge2(wedge2(k1,k2),k3)

is.zero(a1-a2) # NB terms of a1, a2 in a different order!

# This is why wedge(k1,k2,k3) is well-defined. Can also use %^%:
k1 %^% k2 %^% k3
```

| | |
|------------------|--|
| <code>zap</code> | <i>Zap small values in k-forms and k-tensors</i> |
|------------------|--|

Description

Equivalent to `zapsmall()`

Usage

```
zap(X)
## S3 method for class 'kform'
zap(X)
## S3 method for class 'ktensor'
zap(X)
```

Arguments

`X` Tensor or k -form to be zapped

Details

Given an object of class `ktensor` or `kform`, coefficients close to zero are ‘zapped’, i.e., replaced by ‘0’, using `base::zapsmall()`.

Note, `zap()` actually changes the numeric value, it is not just a print method.

Value

Returns an object of the same class

Author(s)

Robin K. S. Hankin

Examples

```
S <- rform(7)
S == zap(S)
```

| | |
|-------------------|------------------------------------|
| <code>zero</code> | <i>Zero tensors and zero forms</i> |
|-------------------|------------------------------------|

Description

Correct idiom for generating zero k -tensors and k -forms

Usage

```
zeroform(n)
zerotensor(n)
```

Arguments

| | |
|---|---------------------------------------|
| n | Arity of the k -form or k -tensor |
|---|---------------------------------------|

Value

Returns an object of class `kform` or `ktensor`.

Note

Idiom such as `as.ktensor(rep(1,n),0)` and `as.kform(rep(1,5),0)` and indeed `as.kform(1:5,0)` is incorrect as the arity of the tensor is lost.

A 0-form is not the same thing as a zero tensor. A 0-form maps V^0 to the reals; a scalar. A zero tensor maps V^k to zero.

Author(s)

Robin K. S. Hankin

See Also

[scalar](#)

Examples

```
as.ktensor(1+diag(5)) + zerotensor(5)
as.kform(matrix(1:6,2,3)) + zeroform(3)

## Following idiom is plausible but fails because as.ktensor(coeffs=0)
## and as.kform(coeffs=0) do not retain arity:

## Not run:
as.ktensor(1+diag(5)) + as.ktensor(rep(1,5),0)    # fails
as.kform(matrix(1:6,2,3)) + as.kform(1:3,0)      # also fails

## End(Not run)
```
