

# Overview of Unmarked: An R Package for the Analysis of Wildlife Data

Ian Fiske and Richard Chandler

April 8, 2010

## Abstract

Unmarked aims to be a complete environment for the statistical analysis of wildlife data. Currently, the focus is on 2-level hierarchical models that separately model a latent state and an observation process. Unmarked uses S4 classes to help the user both explore their data and analyze in a transparent manner.

## 1 Overview of unmarked

Occupancy and abundance data are often associated with metadata related to the design of the study. For example, in distance sampling, the study design (line- or point-transect), distance class break points, transect lengths, and units of measurement need to be accounted for in the analysis. Unmarked uses S4 classes to store data and metadata in a way that allows for easy data manipulation, summarization, and model specification. Table 1 lists the currently implemented models and their associated fitting functions and data classes.

Each data class can be created with a call to the constructor function of the same name as described in the examples below.

## 2 Typical unmarked session

The first step is to import the data into R. This can be accomplished with either a call to the appropriate type of unmarkedFrame:

```
> library(unmarked)
> wt <- read.csv(system.file("csv", "widewt.csv", package = "unmarked"))
> head(wt)
  site y.1 y.2 y.3      elev      forest    length   date.1
1     1   0   0   0 -1.1729446 -1.156228147 1.824549 -1.761481
2     2   0   0   0 -1.1265010 -0.501483710 1.629241 -2.904339

```

or by using the convenience function `csvToUMF`:

```
> wt <- csvToUMF(system.file("csv", "widewt.csv", package = "unmarked"),
+ long = FALSE, type = "unmarkedFrameOccu")
```

If not all sites have the same numbers of observations, then manual importation of data in long format can be tricky. `csvToUMF` seemlessly handles this situation.

```
> pcru <- csvToUMF(system.file("csv", "frog2001pcru.csv",
+ package = "unmarked"), long = TRUE, type = "unmarkedFrameOccu")
> summary(pcru)
unmarkedFrame Object

```

To help stabilize the numerical optimization algorithm, we recommend standardizing the covariates.

```

> obsCovs(pcrus) <- scale(obsCovs(pcrus))

Occupancy models can then be fit with the occu() function:
> fm1 <- occu(~1 ~ 1, pcrus)
> fm2 <- occu(~MinAfterSunset + Temperature ~ 1, pcrus)
> summary(fm1)
Call:
occu(formula = ~1 ~ 1, data = pcrus)

Occupancy (logit-scale):
Estimate SE z P(>|z|)
2.95 1.44 2.05 0.04

Detection (logit-scale):
Estimate SE z P(>|z|)
-0.249 0.170 -1.47 0.142

AIC: 461.0042
Sample size: 130
optim convergence code: 0
optim iterations: 22
Bootstrap iterations: 0
> summary(fm2)
Call:
occu(formula = ~MinAfterSunset + Temperature ~ 1, data = pcrus)

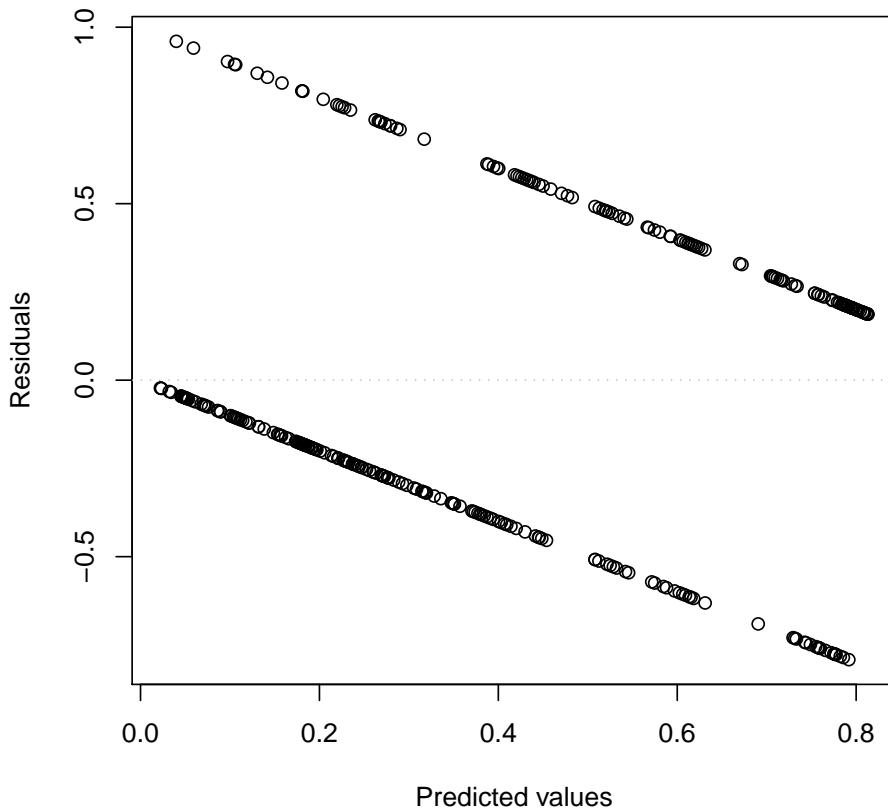

Occupancy (logit-scale):
Estimate SE z P(>|z|)
1.54 0.292 5.26 1.42e-07

Detection (logit-scale):
Estimate SE z P(>|z|)
(Intercept) 0.2098 0.206 1.017 3.09e-01
MinAfterSunset -0.0855 0.160 -0.536 5.92e-01
Temperature -1.8936 0.291 -6.508 7.60e-11

AIC: 356.7591
Sample size: 130
optim convergence code: 0
optim iterations: 21
Bootstrap iterations: 0

```

```
> plot(fm2)
```

Here, we have specified that the detection process is modeled with the MinAfterSunset and Temperature covariates. No covariates are specified for occupancy here. See `?occu` for more details.

Unmarked fitting functions return `unmarkedFit` objects which can be queried to investigate the model fit. Variables can be back-transformed to the unconstrained scale using `backTransform`. Standard errors are computed using the delta method.

```
> backTransform(fm2, "state")
```

```
Backtransformed linear combination(s) of Occupancy estimate(s)
```

Estimate	SE	LinComb	(Intercept)
0.823	0.0425	1.54	1

Transformation: logistic

Because the detection component was modeled with covariates, covariate coefficients must be specified to back-transform. Here, we request the probability of detection given a site is occupied and all covariates are set to 0.

```
> backTransform(linearComb(fm2, coefficients = c(1, 0,
0), type = "det"))
```

```
Backtransformed linear combination(s) of Detection estimate(s)
```

Estimate	SE	LinComb	(Intercept)	MinAfterSunset	Temperature
0.552	0.051	0.210	1	0	0

Transformation: logistic

A predict method also exists.

```

> newData <- data.frame(MinAfterSunset = 0, Temperature = -2:2)
> predict(fm2, type = "det", newdata = newData, appendData = TRUE)
   Predicted      SE MinAfterSunset Temperature
1 0.98196076 0.01266193          0         -2
2 0.89123189 0.04248804          0         -1
3 0.55225129 0.05102660          0          0
4 0.15658708 0.03298276          0          1
5 0.02718682 0.01326263          0          2

```

Confidence intervals are requested with confint, using either the asymptotic normal approximation or profiling.

```

> confint(fm2, type = "det")
            0.025      0.975
(Intercept) -0.1946872  0.6142292
MinAfterSunset -0.3985642  0.2274722
Temperature    -2.4638797 -1.3233511
> confint(fm2, type = "det", method = "profile")
Profiling parameter 1 of 3 ... done.
Profiling parameter 2 of 3 ... done.
Profiling parameter 3 of 3 ... done.
            0.025      0.975
p(Int)        -0.1929210  0.6208837
p(MinAfterSunset) -0.4044794  0.2244221
p(Temperature)   -2.5189984 -1.3789261

```

Model selection and multi-model inference can be implemented after organizing models using the fitList function.

```

> fms <- fitList(Null = fm1, TimeTemp = fm2)
> modSel(fms, nullmod = "Null")
      model n nPars     AIC deltaAIC     AICwt      Rsq cumltvAICwt
2 TimeTemp 130      4  356.76     0.00 1.0000e+00  0.58243           1
1 Null     130      2  461.00   104.25 2.3093e-23  0.00000           1
> predict(fms, type = "det", newdata = newData, appendData = TRUE)
   Predicted      SE MinAfterSunset Temperature
1 0.98196076 0.01266193          0         -2
2 0.89123189 0.04248804          0         -1
3 0.55225129 0.05102660          0          0
4 0.15658708 0.03298276          0          1
5 0.02718682 0.01326263          0          2

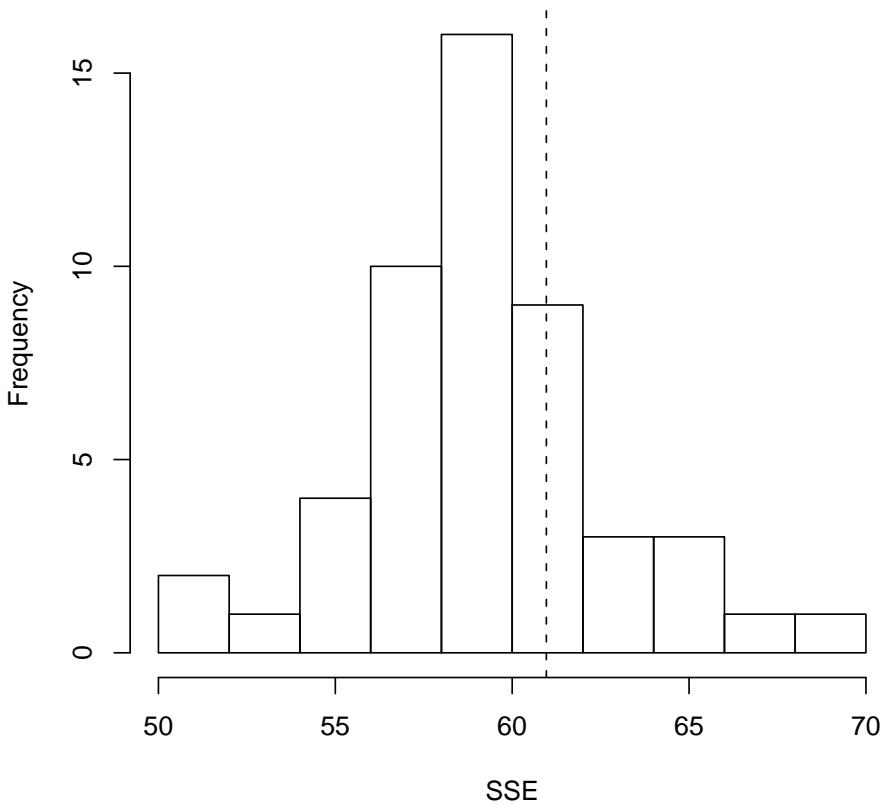

```

Parametric bootstrapping can be used to check the adequacy of model fit.

```

> pcrub.pb <- parboot(fm2, statistic = SSE, nsim = 50, report = 5)
t0 = 60.9664
60.3, 57.5, 59.6, 62.6, 60.8
62.6, 59.3, 59.1, 55.8, 57.7
63.8, 58.7, 61.4, 61.6, 58.3
67, 57, 58.1, 60.3, 55.9
61.3, 58.8, 53.9, 57.6, 60.9
60.3, 59.8, 56.1, 61.3, 62.9
56.7, 59.7, 54, 58, 57.3
62.1, 63.2, 57.6, 57.8, 59.5
67.6, 60.5, 61.3, 59.4, 61.1
56.3, 57.5, 51.6, 64.9, 63.5
> plot(pcrub.pb, main = "")

```

This example suggests an adequate fit.
