Package 'optparse'

April 16, 2024

Encoding UTF-8

Type Package

Title Command Line Option Parser

Version 1.7.5

Description A command line parser inspired by Python's 'optparse' library to be used with Rscript to write ``#!'' shebang scripts that accept short and long flag/options.

optparse-package   *Command line option parser*

Description

Goal is to create an R package of a command line parser inspired by Python's "optparse" library.

Details

`optparse` is primarily intended to be used with "Rscript". It facilitates writing "#!" shebang scripts that accept short and long flags/options. It can also be used from directly, but is probably less useful in this context.

See package vignette for a more detailed example.

Notes on naming convention in package: 1. An option is one of the shell-split input strings. 2. A flag is a type of option. a flag can be defined as having no argument (defined below), a required argument, or an optional argument. 3. An argument is a type of option, and is the value associated with a flag. 4. A long flag is a type of flag, and begins with the string "–". If the long flag has an associated argument, it may be delimited from the long flag by either a trailing =, or may be the subsequent option. 5. A short flag is a type of flag, and begins with the string "-". If a short flag has an associated argument, it is the subsequent option. short flags may be bundled together, sharing a single leading "-"", but only the final short flag is able to have a corresponding argument. *%%%*

[getopt](#)

Examples

```
example_file <- system.file("exec", "example.R", package = "optparse")
example_file_2 <- system.file("exec", "display_file.R", package = "optparse")
## Not run:
    readLines(example_file)
    readLines(example_file_2)

## End(Not run)
```

IndentedHelpFormatter   *Builtin help text formatters*

Description

IndentedHelpFormatter() is the default help text formatter. TitledHelpFormatter() is an alternative help text formatter.

Usage

```
IndentedHelpFormatter(object)

TitledHelpFormatter(object)
```

Arguments

object   An [OptionParser()](#) object.

Value

NULL invisibly. As a side effect prints out help text.

Examples

```
parser <- OptionParser(formatter = IndentedHelpFormatter)
parser <- add_option(parser, "--generator", help = "Generator option")
parser <- add_option(parser, "--count", help = "Count option")
print_help(parser)

parser <- OptionParser(formatter = TitledHelpFormatter)
parser <- add_option(parser, "--generator", help = "Generator option")
parser <- add_option(parser, "--count", help = "Count option")
print_help(parser)
```

---

make_option	*Functions to enable our OptionParser to recognize specific command line options.*

Description

add_option adds a option to a prexisting `OptionParser` instance whereas `make_option` is used to create a list of `OptionParserOption` instances that will be used in the `option_list` argument of the `OptionParser` function to create a new `OptionParser` instance.

Usage

```
make_option(
  opt_str,
  action = NULL,
  type = NULL,
  dest = NULL,
  default = NULL,
  help = "",
  metavar = NULL,
  callback = NULL,
  callback_args = NULL
)

add_option(
  object,
  opt_str,
  action = NULL,
  type = NULL,
  dest = NULL,
  default = NULL,
  help = "",
  metavar = NULL,
  callback = NULL,
  callback_args = NULL
)
```

Arguments

opt_str	A character vector containing the string of the desired long flag comprised of "–" followed by a letter and then a sequence of alphanumeric characters and optionally a string of the desired short flag comprised of the "-" followed by a letter.
action	A character string that describes the action optparse should take when it encounters an option, either "store", "store_true", "store_false", or "callback". An action of "store" signifies that optparse should store the specified following value if the option is found on the command string. "store_true" stores TRUE if the option is found and "store_false" stores FALSE if the option is found. "callback" stores the return value produced by the function specified in the callback argument. If callback is not NULL then the default is "callback" else "store".
type	A character string that describes specifies which data type should be stored, either "logical", "integer", "double", "complex", or "character". Default is "logical" if action %in% c("store_true", store_false), typeof(default) if action == "store" and default is not NULL and "character" if action == "store" and default is NULL. "numeric" will be converted to "double".
dest	A character string that specifies what field in the list returned by parse_args should optparse store option values. Default is derived from the long flag in opt_str.
default	The default value optparse should use if it does not find the option on the command line.
help	A character string describing the option to be used by print_help in generating a usage message. %default will be substituted by the value of default.
metavar	A character string that stands in for the option argument when printing help text. Default is the value of dest.
callback	A function that executes after the each option value is fully parsed. It's value is assigned to the option and its arguments are the option S4 object, the long flag string, the value of the option, the parser S4 object, and . . . .
callback_args	A list of additional arguments passed to callback function (via do.call).
object	An instance of the OptionParser class

Value

Both make_option and add_option return instances of class OptionParserOption.

[parse_args](#) [OptionParser](#)

Examples

```
make_option("--longflag")
make_option(c("-l", "--longflag"))
make_option("--integer", type = "integer", default = 5)
make_option("--integer", default = as.integer(5))  # same as previous

# examples from package vignette
make_option(c("-v", "--verbose"), action = "store_true", default = TRUE,
    help = "Print extra output [default]")
make_option(c("-q", "--quietly"), action = "store_false",
  dest = "verbose", help = "Print little output")
make_option(c("-c", "--count"), type = "integer", default = 5,
    help = "Number of random normals to generate [default %default]",
    metavar = "number")
make_option("--generator", default = "rnorm",
    help = "Function to generate random deviates [default \"%default\"]")
make_option("--mean", default = 0,
    help = "Mean if generator == \"rnorm\" [default %default]")
make_option("--sd", default = 1, metavar = "standard deviation",
    help = "Standard deviation if generator == \"rnorm\" [default %default]")
```

OptionParser   *A function to create an instance of a parser object*

Description

This function is used to create an instance of a parser object which when combined with the
parse_args, make_option, and add_option methods is very useful for parsing options from the
command line.

Usage

```
OptionParser(
  usage = "usage: %prog [options]",
  option_list = list(),
  add_help_option = TRUE,
  prog = NULL,
  description = "",
  epilogue = "",
  formatter = IndentedHelpFormatter
)
```

Arguments

usage	The program usage message that will printed out if parse_args finds a help option, %prog is substituted with the value of the prog argument.
option_list	A list of of OptionParserOption instances that will define how parse_args reacts to command line options. OptionParserOption instances are usually created by make_option and can also be added to an existing OptionParser instance via the add_option function.
add_help_option	
	Whether a standard help option should be automatically added to the OptionParser instance.
prog	Program name to be substituted for %prog in the usage message (including description and epilogue if present), the default is to use the actual Rscript file name if called by an Rscript file and otherwise keep %prog.
description	Additional text for print_help to print out between usage statement and options statement
epilogue	Additional text for print_help to print out after the options statement
formatter	A function that formats usage text. The function should take only one argument (an OptionParser() object). Default is IndentedHelpFormatter(). The other builtin formatter provided by this package is TitledHelpFormatter().

Value

An instance of the OptionParser class.

parse_args make_option add_option

OptionParser-class   *Option Parser*

Description

Option Parser

Slots

usage The program usage message that will printed out if parse_args finds a help option, %prog
       is substituted with the value of the prog argument.

options A list of of OptionParserOption instances that will define how parse_args reacts to
         command line options. OptionParserOption instances are usually created by make_option
         and can also be added to an existing OptionParser instance via the add_option function.

description Additional text for print_help to print out between usage statement and options
             statement

epilogue Additional text for print_help to print out after the options statement

formatter A function that print_help will use to print out after the options statement. Default is
           [IndentedHelpFormatter()](). This package also provides the builtin formatter [TitledHelpFormatter()]().

[OptionParserOption]()

OptionParserOption-class

Class to hold information about command-line options

Description

Class to hold information about command-line options

Slots

short_flag String of the desired short flag comprised of the "-" followed by a letter.

long_flag String of the desired long flag comprised of "–" followed by a letter and then a sequence
           of alphanumeric characters.

action A character string that describes the action optparse should take when it encounters an
        option, either "store", "store_true", or "store_false". The default is "store" which signifies that
        optparse should store the specified following value if the option is found on the command
        string. "store_true" stores TRUE if the option is found and "store_false" stores FALSE if the
        option is found.

type A character string that describes specifies which data type should be stored, either "logi-
      cal", "integer", "double", "complex", or "character". Default is "logical" if action %in%
      c("store_true", store_false), typeof(default) if action == "store" and default is
      not NULL and "character" if action == "store" and default is NULL. "numeric" will be con-
      verted to "double".

dest A character string that specifies what field in the list returned by parse_args should optparse
      store option values. Default is derived from the long flag in opt_str.

default The default value optparse should use if it does not find the option on the command line.

help A character string describing the option to be used by print_help in generating a usage message. %default will be substituted by the value of default.

metavar A character string that stands in for the option argument when printing help text. Default is the value of dest.

callback A function that executes after the each option value is fully parsed

callback_args Additional arguments that pass to the callback function.

parse_args   *Parse command line options.*

Description

parse_args parses command line options using an OptionParser instance for guidance. parse_args2 is a wrapper to parse_args setting the options positional_arguments and convert_hyphens_to_underscores to TRUE.

Usage

```
parse_args(
  object,
  args = commandArgs(trailingOnly = TRUE),
  print_help_and_exit = TRUE,
  positional_arguments = FALSE,
  convert_hyphens_to_underscores = FALSE
)

parse_args2(
  object,
  args = commandArgs(trailingOnly = TRUE),
  print_help_and_exit = TRUE
)
```

Arguments

object   An OptionParser instance.

args   A character vector containing command line options to be parsed. Default is everything after the Rscript program in the command line. If positional_arguments is not FALSE then parse_args will look for positional arguments at the end of this vector.

print_help_and_exit

> Whether `parse_args` should call `print_help` to print out a usage message and exit the program. Default is `TRUE`.

positional_arguments

> Number of *positional* arguments. A numeric denoting the exact number of supported arguments, or a numeric vector of length two denoting the minimum and maximum number of arguments (`Inf` for no limit). The value `TRUE` is equivalent to `c(0, Inf)`. The default `FALSE` is supported for backward compatibility only, as it alters the format of the return value.

convert_hyphens_to_underscores

> If the names in the returned list of options contains hyphens then convert them to underscores. The default `FALSE` is supported for backward compatibility reasons as it alters the format of the return value

Value

Returns a list with field `options` containing our option values as well as another field `args` which contains a vector of positional arguments. For backward compatibility, if and only if `positional_arguments` is `FALSE`, returns a list containing option values.

Acknowledgement

A big thanks to Steve Lianoglou for a bug report and patch; Juan Carlos Borrás for a bug report; Jim Nikelski for a bug report and patch; Ino de Brujin and Benjamin Tyner for a bug report; Jonas Zimmermann for bug report; Miroslav Posta for bug reports; Stefan Seemayer for bug report and patch; Kirill Müller for patches; Steve Humburg for patch.

print_help · *Printing an usage message from an OptionParser object*

Description

print_help print an usage message from an OptionParser object, usually called by parse_args when it encounters a help option.

Usage

```
print_help(object)
```

Arguments

object   A OptionParser instance.

Value

print_help uses the cat function to print out a usage message. It returns invisible(NULL).
